

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

August 8, 2025

Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with **lualatex** only (and won't work with the other engines: **latex**, **pdflatex** and **xelatex**). It does not use external program and the compilation does not require **--shell-escape**. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment **{Piton}**.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages **listings** and **minted**.

The name of this extension (**piton**) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

^{*}This document corresponds to the version 4.8 of **piton**, at the date of 2025/08/08.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by **#>**.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with **LuaLaTeX exclusively**: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

The package `piton` uses and *loads* the package `xcolor`. It does not use any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and two special languages called `minimal` and `verbatim`;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 10 (the parsers of those languages can't be as precise as those of the languages supported natively by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language: \PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the computer languages are always **case-insensitive**. In this example, we might have written `OCaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset computer listings: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 9.
- The command `\PitonInputFile` is used to insert and typeset an external file: cf. 6.3 p. 17.

3.4 The double syntax of the command \piton

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the LaTeX command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|` or `\piton+...+`).

- [Syntax `\piton{...}`](#)

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and also the character of end of line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a %;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are provided for individual braces;
- the LaTeX commands³ of the argument are fully expanded and not executed,
so, it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

<code>\piton{MyString = '\\n'}</code>	<code>MyString = '\n'</code>
<code>\piton{def even(n): return n%2==0}</code>	<code>def even(n): return n%2==0</code>
<code>\piton{c="#" # an affection }</code>	<code>c="#" # an affection</code>
<code>\piton{c="#" \\ \\ # an affection }</code>	<code>c="#" # an affection</code>
<code>\piton{MyDict = {'a': 3, 'b': 4 }}</code>	<code>MyDict = {'a': 3, 'b': 4 }</code>

It's possible to use the command `\piton` with that syntax in the arguments of a LaTeX command.⁴

However, since the argument is expanded (in the TeX sens), one should take care not using in its argument *fragile* commands (that is to say commands which are neither *protected* nor *fully expandable*).

- [Syntax `\piton|...|`](#)

When the argument of the command `\piton` is provided between two identical characters (all the characters are allowed except `%`, `\`, `#`, `{`, `}` and the space), that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

<code>\piton MyString = '\n' </code>	<code>MyString = '\n'</code>
<code>\piton!def even(n): return n%2==0!</code>	<code>def even(n): return n%2==0</code>
<code>\piton+c="#" # an affection +</code>	<code>c="#" # an affection</code>
<code>\piton?MyDict = {'a': 3, 'b': 4}?</code>	<code>MyDict = {'a': 3, 'b': 4}</code>

³That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁴For example, it's possible to use the command `\piton` in a footnote. Example : `s = 123`.

4 Customization

4.1 The keys of the command \PitonOptions

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁵

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). It's possible to use the name of the six built-in languages (`Python`, `OCaml`, `C`, `SQL`, `minimal` and `verbatim`) or the name of a language defined by the user with `\NewPitonLanguage` (cf. part 5, p. 10).

The initial value is `Python`.

- The key `font-command` contains instructions of font which will be inserted at the beginning of all the elements composed by `piton` (without surprise, these instructions are not used for the so-called “LaTeX comments”).

The initial value is `\ttfamily` and, thus, `piton` uses by default the current monospaced font.

- The key `gobble` takes in as value a positive integer n : the first n characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.

When the key `gobble` is used without value, it is equivalent to the key `auto-gobble`, that we describe now.

- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value n of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n .

- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of gobble is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.

- The key `write` takes in as argument a name of file (with its extension) and write the content⁶ of the current environment in that file. At the first use of a file by `piton` (during a given compilation done by LaTeX), it is erased. In fact, the file is written once at the end of the compilation of the file by LuaTeX.

- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `join` is similar to the key `write` but the files which are created are joined (as *joined files*) in the PDF. Be careful: Some PDF readers don't provide any tool to access to these joined files. Among the applications which provide an access to those joined files, we will mention the free application Foxit PDF Reader, which is available on all the platforms.

- The key `print` controls whether the content of the environment is actually printed (with the syntactic formating) in the PDF. Of course, the initial value of `print` is `true`. However, it may be useful to use `print=false` in some circumstances (for example, when the key `write` or the key `join` is used).

- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

⁵We remind that a LaTeX environment is, in particular, a TeX group.

⁶In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 32).

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁷
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁸
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.3.2, p. 17). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.
- The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. It's possible to put, *at the end* of the list, a LaTeX command with one argument, such as, for example, `\fbox`.
The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em ,
        format = \footnotesize \color{blue}
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the special value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.2 on page 33.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` or the key `max-width` described below).

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

⁷For the language Python, the empty lines in the docstrings are taken into account (by design).

⁸When the key `split-on-empty-lines` is in force, the labels of the empty lines are never printed.

New 4.6 In that list, the special color `none` may be used to specify no color at all.

Example : `\PitonOptions{background-color = {gray!15,none}}`

- **New 4.7**

It's possible to use the key `rounded-corners` to require rounded corners for the colored panels drawn by the key `background-color`. The initial value of that is 0 pt, which means that the corners are not rounded. If the key `rounded-corners` is used, the extension `tikz` must be loaded because those rounded corners are drawn by using `tikz`. If `tikz` is not loaded, an error will be raised at the first use of the key `rounded-corners`.

The default value of the key `rounded-corners` is 4 pt.⁹

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt “>>>” (and its continuation “...”) characteristic of the Python consoles with `REPL` (*read-eval-print loop*).
- The key `width` fixes the width of the listing in the PDF. The initial value of that parameter is the current value of `\ linewidth`.

That parameter is used for:

- the breaking the lines which are too long (except, of course, when the key `break-lines` is set to false: cf. p. 19);
- the color of the backgrounds specified by the keys `background-color` and `prompt-background-color` described below;
- the width of the LaTeX box created by the key `box` when that key is used (cf. p. 11);
- the width of the graphical box created by the key `tcolorbox` when that key is used.

- **New 4.6**

The key `max-width` is similar to the key `width` but it fixes the *maximal* width of the lines. If all the lines of the listing are shorter than the value provided to `max-width`, the parameter `width` will be equal to the maximal length of the lines of the listing, that is to say the natural width of the listing.

For legibility of the code, `width=min` is a shortcut for `max-width=\ linewidth`.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters¹⁰ are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹¹

Example : `my_string = 'Very□good□answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹² is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton` — and, therefore, won't be represented by `□`. Moreover, when the key `show-spaces` is in force, the tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C,line-numbers,gobble,background-color=gray!15
            rounded-corners,width=min,splittable=4]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
```

⁹This value is the initial value of the *rounded corners* of TikZ.

¹⁰With the language Python that feature applies only to the short strings (delimited by ' or ") and, in particular, it does not apply for the *doc strings*. In OCaml, that feature does not apply to the *quoted strings*.

¹¹The initial value of `font-command` is `\ttfamily` and, thus, by default, `piton` merely uses the current monospaced font.

¹²cf. 6.4.1 p. 19

```

    swapped = 0;
    for (int j = 0; j < n - i - 1; j++) {
        if (arr[j] > arr[j + 1]) {
            temp = arr[j];
            arr[j] = arr[j + 1];
            arr[j + 1] = temp;
            swapped = 1;
        }
    }
    if (!swapped) break;
}
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 19).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the informatic listings. The customizations done by that command are limited to the current TeX group.¹³

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luacolor` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!30] }
```

¹³We remind that a LaTeX environment is, in particular, a TeX group.

In that example, `\highLight [red!30]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight [red!30]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by piton in the different languages which it supports (Python, OCaml, C, SQL, “minimal” and “verbatim”), are described in the part 9, starting at the page 39.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style. That command is *fully expandable* (in the TeX sens).

For example, it’s possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style `style`.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the computer languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever computer language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it’s also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹⁴

For example, with the command

```
\SetPitonStyle[SQL]{Keyword = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if a computer language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).¹⁵

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style `\PitonStyle{Identifier}` and, therefore, the names of the functions are formatted like the other identifiers (that is to say, by default, with no special formatting except the features provided in `font-command`). However, it’s possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

¹⁴We recall, that, in the package `piton`, the names of the computer languages are case-insensitive.

¹⁵As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

```

\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color [HTML] {CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}
\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for in in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)

```

(Some PDF viewers display a frame around the clickable word `transpose` but other do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of computer languages to which the command will be applied.¹⁶

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

With a LaTeX kernel newer than 2025-06-01, it's possible to use `\NewEnvironmentCopy` on the environment `{Piton}` but it's not very powerful.

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁷

There also exist three other commands `\RenewPitonEnvironment`, `\DeclarePitonEnvironment` and `\ProvidePitonEnvironment`, similar to the corresponding commands of L3.

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{0{}{\PitonOptions{#1}}{}}
```

If one wishes to format Python code in a box of `mdframed`, it's possible to define an environment `{Python}` with the following code (of course, the package `mdframed` must be loaded, and, in this document, it has been loaded with the key `framemethod=tikz`).

```
\NewPitonEnvironment{Python}{}
  {\begin{mdframed}[roundcorner=3mm]}
  {\end{mdframed}}
```

With this new environment `{Python}`, it's possible to write:

¹⁶We remind that, in `piton`, the name of the computer languages are case-insensitive.

¹⁷However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed (of course)

```
\begin{Python}
def square(x):
    """Compute the square of x"""
    return x*x
\end{Python}

def square(x):
    """Compute the square of x"""
    return x*x
```

It's possible to a similar construction with an environment of `tcolorbox`. However, for a better cooperation between `piton` and `tcolorbox`, the extension `piton` provides a key `tcolorbox`: cf. p. 12.

5 Definition of new languages with the syntax of listings

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C, SQL, `minimal` and `verbatim`), which allows more powerful parsers.

For example, in the file `1stlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{{}},%
  morestring=[b]",%
  morestring=[b]',%
} [keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{{}},%
  morestring=[b]",%
  morestring=[b]',%
}
```

It's possible to use the language Java like any other language defined by piton.

Here is an example of code formatted in an environment {Piton} with the key `language=Java`.¹⁸

```
public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}
```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirectives`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `@` and `_` are considered as letters because, in many computer languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

6 Advanced features

6.1 The key “box”

New 4.6

If one wishes to compose a listing in a box of LaTeX, he should use the key `box`. That key takes in as value `c`, `t` or `b` corresponding to the parameter of vertical position (as for the environment `{minipage}` of LaTeX). The default value is `c` (as for `{minipage}`).

When the key `box` is used, `width=min` is activated (except, of course, when the key `width` or the key `max-width` is explicitly used). For the keys `width` and `max-width`, cf. p. 6.

¹⁸We recall that, for piton, the names of the computer languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

```
\begin{center}
\PitonOptions{box,background-color=gray!15}
\begin{Piton}
def square(x):
    return x*x
\end{Piton}
\hspace{1cm}
def cube(x):
    return x*x*x
\end{Piton}
\end{center}
```

```
def square(x):
    return x*x
```

```
def cube(x):
    return x*x*x
```

It's possible to use the key `box` with a numerical value for the key `width`.

```
\begin{center}
\PitonOptions{box=5cm,background-color=gray!15}
\begin{Piton}
def square(x):
    return x*x
\end{Piton}
\hspace{1cm}
def cube(x):
    return x*x*x
\end{Piton}
\end{center}
```

```
def square(x):
    return x*x
```

```
def cube(x):
    return x*x*x
```

Here is an exemple with the key `max-width`.

```
\begin{center}
\PitonOptions{box=t,max-width=7cm,background-color=gray!15}
\begin{Piton}
def square(x):
    return x*x
\end{Piton}
\hspace{1cm}
\begin{Piton}
def P(x):
    return 24*x**8 - 7*x**7 + 12*x**6 - 4*x**5 + 4*x**3 + x**2 - 5*x + 2
\end{Piton}
\end{center}
```

```
def square(x):
    return x*x
```

```
def P(x):
    return 24*x**8 - 7*x**7 + \
+ 12*x**6 - 4*x**5 + 4*x**3 + x**2 - \
+ 5*x + 2
```

6.2 The key “tcolorbox”

The extension `piton` provides a key `tcolorbox` in order to ease the use of the extension `tcolorbox` in conjunction with the extension `piton`. However, the extension `piton` does not load `tcolorbox` and the

final user should have loaded it. Moreover, he must load the library `breakable` of `tcolorbox` with `\tcbuselibrary{breakable}` in the preamble of the LaTeX document. If this is not the case, an error will be raised at the first use of the key `tcolorbox`.

When the key `tcolorbox` is used, the listing formated by `piton` is included in an environment `{tcolorbox}`. That applies both to the command `\PitonInputFile` and the environment `{Piton}` (or, more generally, an environment created by the dedicated command `\NewPitonEnvironment`: cf. p. 9). If the key `splittable` of `piton` is used (cf. p. 20), the graphical box created by `tcolorbox` will be splittable by a change of page.

In the present document, we have loaded, besides `tcolorbox` and its library `breakable`, the library `skins` of `tcolorbox` and we have activated the “*skin*” `enhanced`, in order to have a better appearance at the page break.

```
\tcbuselibrary{skins,breakable} % in the preamble
\tcbset{enhanced} % in the preamble

\begin{Piton}[tcolorbox,splittable=3]
def carré(x):
    """Computes the square of x"""
    return x*x
...
def carré(x):
    """Computes the square of x"""
    return x*x
\end{Piton}
```

```
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
```

```

    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x

```

Of course, if we want to change the color of the background, we won't use the key `background-color` of `piton` but the tools provided by `tcolorbox` (the key `colback` for the color of the background).

If we want to adjust the width of the graphical box to its content, we only have to use the key `width=min` provided by `piton` (cf. p. 6). It's also possible to use `width` or `max-width` with a numerical value. The environment is splittable if the key `splittable` is used (cf. p. 20).

```
\begin{Piton}[tcolorbox, width=min, splittable=3]
def square(x):
    """Computes the square of x"""
    return x*x
...
```

```
def square(x):
    """Computes the square of x"""
    return x*x
\end{Piton}
```

```
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
```

```

    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x

```

If we want an output composed in a LaTeX box (despite its name, an environment of `tcolorbox` does not always create a LaTeX box), we only have to use, in conjunction with the key `tcolorbox`, the key `box` provided by `piton` (cf. p. 11). Of course, such LaTeX box can't be broken by a change of page.

We recall that, when the key `box` is used, `width=min` is activated (except, when the key `width` or the key `max-width` is explicitly used).

```

\begin{center}
\PitonOptions{tcolorbox,box=t}
\begin{Piton}
def square(x):
    return x*x
\end{Piton}
\hspace{1cm}
\begin{Piton}
def cube(x):
    """The cube of x"""
    return x*x*x
\end{Piton}
\end{center}

```

```

def square(x):
    return x*x

```

```

def cube(x):
    """The cube of x"""
    return x*x*x

```

For a more sophisticated example of use of the key `tcolorbox`, see the example given at the page 34.

6.3 Insertion of a file

6.3.1 The command \PitonInputFile

The command `\PitonInputFile` includes the content of the file specified in argument (or only a part of that file: see below). The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

The syntax for the pathes (absolute or relative) is the following one:

- The paths beginning by / are absolute.

Example : \PitonInputFile{/Users/joe/Documents/program.py}

- The paths which do not begin with / are relative to the current repertory.

Example : \PitonInputFile{my_listings/program.py}

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

As previously, the absolute paths must begin with /.

6.3.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
# [Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.¹⁹

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

¹⁹In regard to LaTeX, both functions must be *fully expandable*.

6.4 Page breaks and line breaks

6.4.1 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces which appear in the strings of the computer languages).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`. The initial value of that parameter is `true` (and not `false`).
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return (on the condition that the used font is a monospaced font and this is the case by default since the initial value of `font-command` is `\ttfamily`).
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+ \;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\hookrightarrow ;$`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}

def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
    + ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
            our_dict[name] = [treat_Postscript_line(k) for k in \
            + ↪ list_letter[1:-1]]
    return dict
```

With the key `break-strings-anywhere`, the strings may be broken anywhere (and not only on the spaces).

With the key `break-numbers-anywhere`, the numbers may be broken anywhere.

6.4.2 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, `piton` provides the keys `splittable-on-empty-lines` and `splittable` to allow such breaks.

- The key `splittable-on-empty-lines` allows breaks on the empty lines. The “empty lines” are in fact the lines which contains only spaces.
- Of course, the key `splittable-on-empty-lines` may not be sufficient and that’s why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines.²⁰

For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it’s probably not recommandable).

The initial value of the key `splittable` is equal to 100 (by default, the listings are not breakable at all).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.

With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

We illustrate that point with the following code (the current environment `{tcolorbox}` uses the key `breakable`).

```
\begin{Piton}[background-color=gray!30,rounded-corners,width=min,splittable=4]
def square(x):
    """Computes the square of x"""
    return x*x
...
def square(x):
    """Computes the square of x"""
    return x*x
\end{Piton}

def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
```

²⁰Remark that we speak of the lines of the original informatic listing and such line may be composed on several lines in the final PDF when the key `break-lines-in-Piton` is in force.

```

def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x

```

6.5 Splitting of a listing in sub-listings

The extension `piton` provides the key `split-on-empty-lines`, which should not be confused with the key `splittable-on-empty-lines` previously defined.

In order to understand the behaviour of the key `split-on-empty-lines`, one should imagine that he has to compose an informatic listing which contains several definitions of informatic functions. Usually, in the informatic languages, those definitions of functions are separated by empty lines.

The key `split-on-empty-lines` splits the listings on the empty lines. Several empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`.

- That parameter must contain elements allowed to be inserted in *vertical mode* of TeX. For example, it's possible to put the TeX primitive `\hrule`.
- The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break). If the key `background-color` is in force, no background color is added to that empty line.

Each chunk of the informatic listing is composed in an environment whose name is given by the key `env-used-by-split`. The initial value of that parameter is, not surprisingly, `Piton` and, hence, the different chunks are composed in several environments `{Piton}`. If one decides to change the value of `env-used-by-split`, he should use the name of an environment created by `\NewPitonEnvironment` (cf. part 4.3, p. 9).

Each chunk of the informatic listing is formated in its own environment. Therefore, it has its own line numbering (if the key `line-numbers` is in force) and its own colored background (when the key `background-color` is in force), separated from the background color of the other chunks. When used, the key `splittable` applies in each chunk (independently of the other chunks). Of course, a page break may occur between the chunks of code, regardless of the value of `splittable`.

```
\begin{Piton}[split-on-empty-lines,background-color=gray!15,line-numbers]
def square(x):
```

```

    """Computes the square of x"""
    return x*x

def cube(x):
    """Calcule the cube of x"""
    return x*x*x
\end{Piton}

1 def square(x):
2     """Computes the square of x"""
3     return x*x

1 def cube(x):
2     """Calcule the cube of x"""
3     return x*x*x

```

Caution: Since each chunk is treated independently of the others, the commands specified by `detected-commands` or `raw-detected-commands` (cf. p. 24) and the commands and environments of Beamer automatically detected by `piton` must not cross the empty lines of the original listing.

6.6 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to automatically change the formatting of some identifiers. That change is only based on the name of those identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the computer languages of `piton`.²¹
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf. 4.2 p. 7).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```

\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

```

²¹We recall, that, in the package `piton`, the names of the computer languages are case-insensitive.

```

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [x for x in l[1:] if x < a ]
        l2 = [x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)

```

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by piton.

```

\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)

```

6.7 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the keys `detected-commands`, `raw-detected-commands` and `vertical-detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 6.8 p. 28.

6.7.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It’s possible to change the formatting of the LaTeX comment itself by changing the `piton style Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part [8.3 p. 34](#)

If the user has required line numbers (with the key `line-numbers`), it’s possible to refer to a number of line with the command `\label` used in a LaTeX comment.²² The same goes for the `\zlabel` command from the `zref` package.²³

6.7.2 The key “label-as-zlabel”

The key `label-as-zlabel` will be used to indicate if the user wants `\label` inside Piton environments to be replaced by a `\zlabel`-compatible command (which is the default behavior of `zref` outside of such environments).

That feature is activated by the key `label-as-zlabel`, which is available only in the preamble of the document.

6.7.3 The key “math-comments”

It’s possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

```
\PitonOptions{math-comment} % in the preamble

\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

6.7.4 The key “detected-commands” and its variants

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).

²²That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.).

²³Using the command `\zcref` command from `zref-clever` is also supported.

- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).
- These commands must be **protected**²⁴ against expansion in the TeX sens (because the command \piton expands its arguments before throwing it to Lua for syntactic analysis).

In the following example, which is a recursive programmation of the factorial function, we decide to highlight the recursive call. The command \highLight of lua-ul²⁵ directly does the job with the easy syntax \highLight{...}.

We assume that the preamble of the LaTeX document contains the following line:

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

The key `raw-detected-commands` is similar to the key `detected-commands` but piton won't do any syntactic analysis of the arguments of the LaTeX commands which are detected.

If there is a line break within the argument of a command detected by the mean of `raw-detected-commands`, that line break is replaced by a space (as does LaTeX by default).

Imagine, for example, that we wish, in the main text of a document about databases, introduce some specifications of tables of the language SQL by the name of the table, followed, between brackets, by the names of its fields (ex. : `client(name,town)`).

If we insert that element in a command \piton, the word `client` won't be recognized as a name of table but as a name of field. It's possible to define a personal command \NomTable which we will apply by hand to the names of the tables. In that aim, we declare that command with `raw-detected-commands` and, thus, its argument won't be re-analyzed by piton (that second analysis would format it as a name of field).

In the preamble of the LaTeX document, we insert the following lines:

```
\NewDocumentCommand{\NameTable}{m}{\PitonStyle{Name.Table}{#1}}
\PitonOptions{language=SQL, raw-detected-commands = NameTable}
```

In the main document, the instruction:

```
Exemple : \piton{\NameTable{client}} (name, town)}
```

²⁴We recall that the command \NewDocumentCommand creates protected commands, unlike the historical LaTeX command \newcommand (and unlike the command \def of TeX).

²⁵The package lua-ul requires itself the package luacolor.

produces the following output :

Exemple : `client (nom, prénom)`

New 4.6

The key `vertical-detected-commands` is similar to the key `raw-detected-commands` but the commands which are detected by this key must be LaTeX commands (with one argument) which are executed in *vertical* mode between the lines of the code.

For example, it's possible to detect the command `\newpage` by

```
\PitonOptions{vertical-detected-commands = newpage}
```

and ask in a listing a mandatory break of page with `\newpage{}`:

```
\begin{Piton}
def square(x):
    return x*x  \newpage{}
def cube(x):
    return x*x*x
\end{Piton}
```

6.7.5 The mechanism “escape”

It's also possible to overwrite the informatic listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `lua-ul`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!, end-escape=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

Caution : The mechanism “escape” is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

6.7.6 The mechanism “escape-math”

The mechanism “escape-math” is very similar to the mechanism “escape” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “escape-math” is in fact rather different from that of the mechanism “escape”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and, therefore, they can’t be used to change the formatting of other lexical units.

In the languages where the character \$ does not play a important role, it’s possible to activate that mechanism “escape-math” with the character \$:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Note: the character \$ must *not* be protected by a backslash.

However, it’s probably more prudent to use \(`` et ``\), which are delimiters of the mathematical mode provided by LaTeX.

```
\PitonOptions{begin-escape-math=\(`,end-escape-math=\)`}
```

Here is an example of use.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(` < 0`):
        return \(`-\arctan(-x)`)
    elif \(` > 1`):
        return \(`\pi/2 - \arctan(1/x)`)
    else:
        s = \(`0`)
        for \(`k`) in range(\(`n`)):
            s += \(`\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}`)
        return s
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0 :
3         return -arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s
```

6.7.7 The command `\rowcolor`

New 4.8

The extension piton provides a command `\rowcolor` which, when place within a line of code, specifies that this line will have a colored background (with the color in the argument²⁶ of the command).

We documente that command in the part which deals about the escapes to LaTeX because this command can only be used through an escape to LaTeX, for example with the key `raw-detected-commands` (cf. p. 24).

²⁶The command `\rowcolor` takes in only one argument. There is no optional argument between square brackets for the colorimetric space. However, it’s possible to write something like `\rowcolor{[rgb]{0.8,1,0.8}}`.

```
\PitonOptions{raw-detected-commands = rowcolor} % in the preamble

\begin{Piton}[width=min]
def fact(n):
    if n==0:
        return 1 \rowcolor{yellow!50}
    else:
        return n*fact(n-1)
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

Here is now the same example with the join use of the key `background-color` (cf. p. 5).

```
\begin{Piton}[width=min,background-color=gray!15]
def fact(n):
    if n==0:
        return 1 \rowcolor{yellow!50}
    else:
        return n*fact(n-1)
\end{Piton}
```

```
def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

As you can see, a margin has been added on both sides of the code by the key `background-color`. If you wish those margins without general background, you should use `background-color` with the special value `none`.

```
\begin{Piton}[width=min,background-color=none]
def fact(n):
    if n==0:
        return 1 \rowcolor{yellow!50}
    else:
        return n*fact(n-1)
\end{Piton}
```

```
def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

6.8 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.²⁷

When the package `piton` is used within the class `beamer`²⁸, the behaviour of `piton` is slightly modified, as described now.

6.8.1 `{Piton}` and `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

²⁷Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

²⁸The extension `piton` detects the class `beamer` and the package `beameralternative` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

6.8.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause29` ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ; It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings³⁰ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "`{`" and "`}`" are correctly interpreted (without any escape character).

6.8.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following environments of `Beamer` are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleref}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

²⁹One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

³⁰The short strings of Python are the strings delimited by characters '`'` or the characters "`"` and not '`'''` nor '`"""`'. In Python, the short strings can't extend on several lines.

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
    return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}
```

Remark concerning the command `\alert` and the environment `{alertenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```
\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother
```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

6.9 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

Important remark : If you use Beamer, you should know that Beamer has its own system to extract the footnotes. Therefore, `piton` must be loaded in that class without the option `footnote` nor the option `footnotehyper`.

By default, in an environment `{Piton}`, a command `\footnote` may appear only within a “LaTeX comment”. But it’s also possible to add the command `\footnote` to the list of the “*detected-commands*” (cf. part 6.7.4, p. 24).

In this document, the package `piton` has been loaded with the option `footnotehyper` dans we added the command `\footnote` to the list of the “*detected-commands*” with the following instruction in the preamble of the LaTeX document.

```
\PitonOptions{detected-commands = footnote}

\PitonOptions{background-color=gray!15}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)31
    elif x > 1:
        return pi/2 - arctan(1/x)32
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can’t be broken by a page break.

```
\PitonOptions{background-color=gray!15}
\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

³¹First recursive call.

³²Second recursive call.

6.10 Tabulations

Even though it's probably recommended to indent the informatics listings with spaces and not tabulations³³, piton accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of piton (in lower case).

The extension piton provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of piton.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` and its variants (cf. part 6.7.4) and the elements inserted by the mechanism “escape” (cf. part 6.7.5).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.5, p. 38.

8 Examples

8.1 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 7.

We present now an example of tuning of these styles adapted to the documents in black and white. That tuning uses the command `\highLight` of `luatex` (that package requires itself the package `luacolor`).

```
\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
```

³³For the language Python, see the note PEP 8.

```

Comment.LaTeX = \normalfont \color{gray},
Keyword = \bfseries ,
Name.Namespace = ,
Name.Class = ,
Name.Type = ,
InitialValues = \color{gray}
}

```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in piton is *not* empty.

```

from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = π/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
        return s

```

8.2 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the informatic listings by using the key `line-numbers` (used without value).

By default, the numbers of the lines are composed by piton in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```

\PitonOptions{background-color=gray!15, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)      #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)      (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )

```

8.3 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with #>) aligned on the right margin.

```
\PitonOptions{background-color=gray!15}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`.

```
\PitonOptions{background-color=gray!15, width=9cm}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)      another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

8.4 Use with `tcolorbox`

The key `tcolorbox` of piton has been presented at the page [12](#).

If, when that key is used, we wish to customize the graphical box created by `tcolorbox` (with the keys provided by `tcolorbox`), we should use the command `\tcbset` provided by `tcolorbox`. In order to limit the scope of the settings done by that command, the best way is to create a new environment with the dedicated command `\NewPitonEnvironment` (cf. p. 9). That environment will contain the settings done by `piton` (with `\PitonOptions`) and those done by `tcolorbox` (with `\tcbset`).

Here is an example of such environment `{Python}` with a colored column on the left for the numbers of lines. That example requires the library `skins` of `tcolorbox` to be loaded in the preamble of the LaTeX document with the instruction `\tcbuselibrary{skins}` (in order to be able to use the key `enhanced`).

```
\NewPitonEnvironment{Python}{m}
{%
\PitonOptions
{
    tcolorbox,
    splittable=3,
    width=min,
    line-numbers,           % activate the numbers of lines
    line-numbers =          % tuning for the numbers of lines
    {
        format = \footnotesize\color{white}\sffamily ,
        sep = 2.5mm
    }
}%
\tcbset
{
    enhanced,
    title=#1,
    fonttitle=\sffamily,
    left = 6mm,
    top = 0mm,
    bottom = 0mm,
    overlay=
    {%
        \begin{tcbclipinterior}%
            \fill[gray!80]
                (frame.south west) rectangle
                ([xshift=6mm]frame.north west);
        \end{tcbclipinterior}%
    }
}
{ }
```

In the following example of use, we have illustrated the fact that it is possible to impose a break of page in such environment with `\newpage{}` if we have required the detection of the LaTeX command `\newpage` with the key `vertical-detected-commands` (cf. p. 24) in the preamble of the LaTeX document.

Remark that we must use `\newpage{}` and not `\newpage` because the LaTeX commands detected by `piton` are meant to be commands with one argument (between curly braces).

```
\PitonOptions{vertical-detected-commands = newline} % in the preamble
```

```
\begin{Python}{My example}
def square(x):
    """Computes the square of x"""

```

```

        return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x \newpage{}
def square(x):
    """Computes the square of x"""
    return x*x
...
def square(x):
    """Computes the square of x"""
    return x*x
\end{Python}

```

My example

```

1 def square(x):
2     """Computes the square of x"""
3     return x*x
4 def square(x):
5     """Computes the square of x"""
6     return x*x
7 def square(x):
8     """Computes the square of x"""
9     return x*x
10 def square(x):
11     """Computes the square of x"""
12     return x*x

```

```

13 def square(x):
14     """Computes the square of x"""
15     return x*x
16 def square(x):
17     """Computes the square of x"""
18     return x*x
19 def square(x):
20     """Computes the square of x"""
21     return x*x
22 def square(x):
23     """Computes the square of x"""
24     return x*x
25 def square(x):
26     """Computes the square of x"""
27     return x*x
28 def square(x):
29     """Computes the square of x"""
30     return x*x
31 def square(x):
32     """Computes the square of x"""
33     return x*x
34 def square(x):
35     """Computes the square of x"""
36     return x*x
37 def square(x):
38     """Computes the square of x"""
39     return x*x
40 def square(x):
41     """Computes the square of x"""
42     return x*x
43 def square(x):
44     """Computes the square of x"""
45     return x*x
46 def square(x):
47     """Computes the square of x"""
48     return x*x
49 def square(x):
50     """Computes the square of x"""
51     return x*x
52 def square(x):
53     """Computes the square of x"""
54     return x*x
55 def square(x):
56     """Computes the square of x"""
57     return x*x
58 def square(x):
59     """Computes the square of x"""
60     return x*x
61 def square(x):
62     """Computes the square of x"""
63     return x*x
64 def square(x):
65     """Computes the square of x"""
66     return x*x
67 def square(x):
68     """Computes the square of x"""
69     return x*x

```

```

70 def square(x):
71     """Computes the square of x"""
72     return x*x
73 def square(x):
74     """Computes the square of x"""
75     return x*x
76 def square(x):
77     """Computes the square of x"""
78     return x*x
79 def square(x):
80     """Computes the square of x"""
81     return x*x
82 def square(x):
83     """Computes the square of x"""
84     return x*x

```

8.5 Use with pyluatex

The package `pylumatex` is an extension which allows the execution of some Python code from `lualatex` (as long as Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `\PitonExecute` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```

\NewPitonEnvironment{\PitonExecute}{!0{}}
{\PitonOptions{#1}}
{\begin{center}
 \directlua{pylumatex.execute(piton.get_last_code(), false, true, false, true)}%
 \end{center}}
\ignorespacesafterend

```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 32.

This environment `\PitonExecute` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` of Pygments, as applied by Pygments to the language Python.³⁴

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }) ; that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }) ; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is <code>\PitonStyle{Identifier}</code> and, therefore, the names of that functions are formatted like the identifiers).
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>in</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .
<code>Identifier</code>	the identifiers.

³⁴See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color `#F0F3F3`. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with the key language: language = OCaml.

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is \PitonStyle{Identifier} and, therefore, the names of that functions are formatted like the identifiers).
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, done, downto, do, else, exception, for, function , fun, if, lazy, match, mutable, new, of, private, raise, then, to, try , virtual, when, while and with
Keyword.Governing	the following keywords: and, begin, class, constraint, end, external, functor, include, inherit, initializer, in, let, method, module, object, open, rec, sig, struct, type and val.
Identifier	the identifiers.

9.3 The language C (and C++)

It's possible to switch to the language C with the key `language = C`.

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the characters (between ')
<code>String.Long</code>	the strings (between ")
<code>String.Interpol</code>	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style <code>String.Long</code>
<code>Operator</code>	the following operators : != == << >> - ~ + / * % = < > & . @
<code>Name.Type</code>	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, uint8_t, uint16_t, uint32_t, uint64_t, long, short, signed, unsigned, void et wchar_t
<code>Name.Builtin</code>	the following predefined functions: printf, scanf, malloc, sizeof and alignof
<code>Name.Class</code>	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is \PitonStyle{Identifier} and, therefore, the names of that functions are formatted like the identifiers).
<code>Preproc</code>	the instructions of the preprocessor (beginning par #)
<code>Comment</code>	the comments (beginning by // or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword.Constant</code>	default, false, NULL, nullptr and true
<code>Keyword</code>	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while
<code>Identifier</code>	the identifiers.

9.4 The language SQL

It's possible to switch to the language SQL with the key `language = SQL`.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): abort, action, add, after, all, alter, always, analyze, and, as, asc, attach, autoincrement, before, begin, between, by, cascade, case, cast, check, collate, column, commit, conflict, constraint, create, cross, current, current_date, current_time, current_timestamp, database, default, deferrable, deferred, delete, desc, detach, distinct, do, drop, each, else, end, escape, except, exclude, exclusive, exists, explain, fail, filter, first, following, for, foreign, from, full, generated, glob, group, groups, having, if, ignore, immediate, in, index, indexed, initially, inner, insert, instead, intersect, into, is, isnull, join, key, last, left, like, limit, match, materialized, natural, no, not, nothing, notnull, null, nulls, of, offset, on, or, order, others, outer, over, partition, plan, pragma, preceding, primary, query, raise, range, recursive, references, regexp, reindex, release, rename, replace, restrict, returning, right, rollback, row, rows, savepoint, select, set, table, temp, temporary, then, ties, to, transaction, trigger, unbounded, union, unique, update, using, vacuum, values, view, virtual, when, where, window, with, without

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new computer languages with the syntax of the extension `listings`, has been described p. 10.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)
<code>Identifier</code>	the identifiers.

Here is for example a definition for the language HTML, obtained with a slight adaptation of the definition done by `listings` (file `lstlang1.sty`).

```
\NewPitonLanguage{HTML}%
{morekeywords={A,ABBR,ACRONYM,ADDRESS,APPLET,AREA,B,BASE,BASEFONT,%
BDO,BIG,BLOCKQUOTE,BODY,BR,BUTTON,CAPTION,CENTER,CITE,CODE,COL,%
COLGROUP,DD,DEL,DFN,DIR,DIV,DL,DOCTYPE,DT,EM,FIELDSET,FONT,FORM,%
FRAME,FRAMESET,HEAD,HR,H1,H2,H3,H4,H5,H6,HTML,I,IFRAME,IMG,INPUT,%
INS,ISINDEX,KBD,LABEL,LEGEND,LH,LI,LINK,LISTING,MAP,META,MENU,%
NOFRAMES,NOSCRIPT,OBJECT,OPTGROUP,OPTION,P,PARAM,PLAINTEXT,PRE,%
OL,Q,S,SAMP,SCRIPT,SELECT,SMALL,SPAN,STRIKE,STRING,STRONG,STYLE,%
SUB,SUP,TABLE,TBODY,TD,TEXTAREA,TFOOT,TH,THEAD,TITLE,TR,TT,U,UL,%
VAR,XMP,%
accesskey,action,align,alink,alt,archive,axis,background,bgcolor,%
border,cellpadding,cellspacing,charset,checked,cite,class,classid,%

9.6 The language “minimal”

It's possible to switch to the language “minimal” with the key `language = minimal`.

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Identifier</code>	the identifiers.

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.6, p. 22) in order to create, for example, a language for pseudo-code.

9.7 The language “verbatim”

It's possible to switch to the language “verbatim” with the key `language = verbatim`.

Style	Usage
<code>None...</code>	

The language `verbatim` doesn't provide any style and, thus, does not do any syntactic formating. However, it's possible to use the mechanism `detected-commands` (cf. part 6.7.4, p. 24) and the detection of the commands and environments of Beamer.

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code *with interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³⁵

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{"
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}}" }
{ luatexbase.catcodetables.CatcodeTableOther, " "
{ "{\PitonStyle{Name.Function}{"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, "      " }
{ "{\PitonStyle{Keyword}{"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}}" }
{ luatexbase.catcodetables.CatcodeTableOther, " "
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}}" }
{ "{\PitonStyle{Number}{"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}}" }
{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³⁵Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton\_end\_line:
```

10.2 The L3 part of the implementation

10.2.1 Declaration of the package

15  { }
16  { \msg_fatal:nn { piton } { latex-too-old } }
```

The command \text provided by the package `amstext` will be used to allow the use of the command \pion{...} (with the standard syntax) in mathematical mode.

```
17 \RequirePackage { amstext }
18 \ProvideDocumentCommand { \IfPackageLoadedT } { m m }
19   { \IfPackageLoadedTF { #1 } { #2 } { } }
20
21 \ProvideDocumentCommand { \IfPackageLoadedF } { m m }
22   { \IfPackageLoadedTF { #1 } { } { #2 } }
23
24 \ProvideDocumentCommand { \IfClassLoadedF } { m m }
25   { \IfClassLoadedTF { #1 } { } { #2 } }
26
27 \ProvideDocumentCommand { \IfClassLoadedF } { m m }
28   { \IfClassLoadedTF { #1 } { } { #2 } }

29 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
30 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
31 \cs_new_protected:Npn \@@_warning:nn { \msg_warning:nnn { piton } }
32 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }
33 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { piton } }
34 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { piton } }
35 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { piton } }
36 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { piton } }
```

With Overleaf (and also TeXPage), by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
37 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
```

```

38   {
39     \bool_if:NTF \g_@@_messages_for_Overleaf_bool
40       { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
41       { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
42   }

We also create commands which will generate usually an error but only a warning on Overleaf. The argument is given by curryingification.
43 \cs_new_protected:Npn \@@_error_or_warning:n
44   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
45 \cs_new_protected:Npn \@@_error_or_warning:nn
46   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:nn \@@_error:nn }

We try to detect whether the compilation is done on Overleaf. We use \c_sys_jobname_str because, with Overleaf, the value of \c_sys_jobname_str is always "output".
47 \bool_new:N \g_@@_messages_for_Overleaf_bool

160     { \usepackage { footnotehyper } }
161     \bool_gset_true:N \g_@@_footnote_bool
162 }
163 }

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

10.2.2 Parameters and technical definitions

```

164 \dim_new:N \l_@@_rounded_corners_dim
165 \bool_new:N \l_@@_in_label_bool
166 \dim_new:N \l_@@_tmpc_dim

```

The listing that we have to format will be stored in `\l_@@_listing_tl`. That applies both for the command `\PitonInputFile` and the environment `{Piton}` (or another environment defined by `\NewPitonEnvironment`).

```
167 \tl_new:N \l_@@_listing_tl
```

The content of an environment such as `{Piton}` will be composed first in the following box, but that box be *unboxed* at the end.

```

168 \box_new:N \g_@@_output_box
169 \box_new:N \l_@@_line_box

```

The following string will contain the name of the computer language considered (the initial value is `python`).

```

170 \str_new:N \l_piton_language_str
171 \str_set:Nn \l_piton_language_str { python }

```

Each time an environment of `piton` is used, the computer listing in the body of that environment will be stored in the following global string.

```
172 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
173 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
174 \str_new:N \l_@@_path_write_str
```

The following parameter corresponds to the key `tcolorbox`.

```
175 \bool_new:N \l_@@_tcolorbox_bool
176 % \end{macrocode}
177 %
178 % \medskip
179 % The following parameter corresponds to the key |box|.
180 % \begin{macrocode}
181 \str_new:N \l_@@_box_str
182 % \end{macrocode}
183 %
184 % \medskip
185 % In order to have a better control over the keys.
186 % \begin{macrocode}
187 \bool_new:N \l_@@_in_PitonOptions_bool
188 \bool_new:N \l_@@_in_PitonInputFile_bool
```

The following parameter corresponds to the key `font-command`.

```
189 \tl_new:N \l_@@_font_command_tl
190 \tl_set:Nn \l_@@_font_command_tl { \ttfamily }
```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```
191 \int_new:N \g_@@_nb_lines_int
```

The same for the number of non-empty lines of the listings.

```
192 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors).

```
193 \int_new:N \g_@@_line_int
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to *n*, then no line break can occur within the first *n* lines or the last *n* lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

```
194 \int_new:N \l_@@_splittable_int
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
195 \int_set:Nn \l_@@_splittable_int { 100 }
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the computer listing provided by the final user is split in chunks on the empty lines in the code).

```
196 \tl_new:N \l_@@_split_separation_tl
197 \tl_set:Nn \l_@@_split_separation_tl
198 { \vspace { \baselineskip } \vspace { -1.25pt } }
```

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
199 \clist_new:N \l_@@_bg_color_clist
```

We will also keep in memory the length of the previous `clist` (for efficiency).

```
200 \int_new:N \l_@@_bg_colors_int
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
201 \tl_new:N \l_@@_prompt_bg_color_tl
```

```
202 \tl_new:N \l_@@_space_in_string_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
203 \str_new:N \l_@@_begin_range_str  
204 \str_new:N \l_@@_end_range_str
```

The following boolean corresponds to the key `math-comments` (available only in the preamble of the LaTeX document).

```
205 \bool_new:N \g_@@_math_comments_bool
```

The argument of `\PitonInputFile`.

```
206 \str_new:N \l_@@_file_name_str
```

The following flag corresponds to the key `print`. The initial value of that parameter will be `true` (and not `false`) since, of course, by default, we want to print the content of the environment `{Piton}`

```
207 \bool_new:N \l_@@_print_bool  
208 \bool_set_true:N \l_@@_print_bool
```

The parameter `\l_@@_write_str` corresponds to the key `write`.

```
209 \str_new:N \l_@@_write_str
```

The parameter `\l_@@_join_str` corresponds to the key `join`. In fact, `\l_@@_join_str` won't contain the exact value used the final user but its conversion in "utf16/hex".

```
210 \str_new:N \l_@@_join_str
```

The following boolean corresponds to the key `show-spaces`.

```
211 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
212 \bool_new:N \l_@@_break_lines_in_Piton_bool  
213 \bool_set_true:N \l_@@_break_lines_in_Piton_bool  
214 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
215 \tl_new:N \l_@@_continuation_symbol_tl  
216 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
217 \tl_new:N \l_@@_csoi_tl  
218 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
219 \tl_new:N \l_@@_end_of_broken_line_tl  
220 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
221 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`. If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.

```
222 \dim_new:N \l_@@_width_dim  
223 % \end{macrocode}  
224 %  
225 % \bigskip  
226 % |\g_@@_width_dim| will be the width of the environment, after construction.  
227 % In particular, if |max-width| is used, |\g_@@_width_dim| has to be computed  
228 % from the actual content of the environment.  
229 % \begin{macrocode}  
230 \dim_new:N \g_@@_width_dim
```

We will also use another dimension called `\l_@@_code_width_dim`. That will be the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

231 `\dim_new:N \l_@@_code_width_dim`

The following flag will be raised when the key `max-width` (and when `width` is used with the key `min`, which is equivalent to `max-width=\linewidth`).

232 `\bool_new:N \l_@@_minimize_width_bool`

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

233 `\dim_new:N \l_@@_left_margin_dim`

The following boolean will be set when the key `left-margin=auto` is used.

234 `\bool_new:N \l_@@_left_margin_auto_bool`

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

235 `\dim_new:N \l_@@_numbers_sep_dim`

236 `\dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }`

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

237 `\seq_new:N \g_@@_languages_seq`

238 `\int_new:N \l_@@_tab_size_int`

239 `\int_set:Nn \l_@@_tab_size_int { 4 }`

240 `\cs_new_protected:Npn \@@_tab:`

241 `{`

242 `\bool_if:NTF \l_@@_show_spaces_bool`

243 `{`

244 `\hbox_set:Nn \l_tmpa_box`

245 `{ \prg_replicate:nn \l_@@_tab_size_int { ~ } }`

246 `\dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }`

247 `\(\mathcolor{gray}`

248 `{ \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } } \)`

249 `}`

250 `{ \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } }`

251 `\int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int`

252 `}`

The following integer corresponds to the key `gobble`.

253 `\int_new:N \l_@@_gobble_int`

The following token list will be used only for the spaces in the strings.

254 `\tl_set_eq:NN \l_@@_space_in_string_tl \nobreakspace`

When the key `break-lines-in-piton` is set, that parameter will be replaced by `\space` (in `\piton` with the standard syntax) and when the key `show-spaces-in-strings` is set, it will be replaced by `□` (U+2423).

At each line, the following counter will count the spaces at the beginning.

255 `\int_new:N \g_@@_indentation_int`

Be careful: when executed, the following command does *not* create a space (only an incrementation of the counter).

256 `\cs_new_protected:Npn \@@_leading_space:`

257 `{ \int_gincr:N \g_@@_indentation_int }`

In the environment `{Piton}`, the command `\label` will be linked to the following command.

258 `\cs_new_protected:Npn \@@_label:n #1`

259 `{`

260 `\bool_if:NTF \l_@@_line_numbers_bool`

```

261      {
262          \@bsphack
263          \protected@write \auxout { }
264          {
265              \string \newlabel { #1 }
266              {
267                  \int_use:N \g_@@_visual_line_int }
268                  \thepage
269                  {
270                      \line.#1
271                  }
272              }
273          }
274          \@esphack
275          \IfPackageLoadedT { hyperref }
276          { \Hy@raisedlink { \hyper@anchorstart { line.#1 } \hyper@anchorend } }
277      }
278      { \@@_error:n { label-with-lines-numbers } }
279  }

```

The same goes for the command `\zlabel` if the `zref` package is loaded. Note that `\label` will also be linked to `\@@_zlabel:n` if the key `label-as-zlabel` is set to `true`.

```

280 \cs_new_protected:Npn \@@_zlabel:n #1
281  {
282      \bool_if:NTF \l_@@_line_numbers_bool
283      {
284          \@bsphack
285          \protected@write \auxout { }
286          {
287              \string \zref@newlabel { #1 }
288              {
289                  \string \default { \int_use:N \g_@@_visual_line_int }
290                  \string \page { \thepage }
291                  \string \zc@type { line }
292                  \string \anchor { line.#1 }
293              }
294          }
295          \@esphack
296          \IfPackageLoadedT { hyperref }
297          { \Hy@raisedlink { \hyper@anchorstart { line.#1 } \hyper@anchorend } }
298      }
299      { \@@_error:n { label-with-lines-numbers } }
300  }

```

In the environments `{Piton}` the command `\rowcolor` will be linked to the following one.

```

301 \cs_new_protected:Npn \@@_rowcolor:n #1
302  {
303      \tl_gset:ce { g_@@_color_ \int_eval:n { \g_@@_line_int + 1 }_ tl } { #1 }
304      \bool_gset_true:N \g_@@_rowcolor_inside_bool
305  }

```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

These macros must *not* be protected.

```

306 \cs_new:Npn \@@_marker_beginning:n #1 { }
307 \cs_new:Npn \@@_marker_end:n #1 { }

```

The following token list will be evaluated at the beginning of `\@@_begin_line:... \@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```

308 \tl_new:N \g_@@_before_line_tl
309 \tl_new:N \g_@@_after_line_tl

```

The spaces at the end of a line of code are deleted by `piton`. However, it's not actually true: they are replaced by `\@@_trailing_space:`.

```
310 \cs_new_protected:Npn \@@_trailing_space: { }
```

When we have to rescan some pieces of code, we will use `\@@_piton:n`, which we will set `\@@_trailing_space:` equal to `\space`.

```

311 \bool_new:N \g_@@_color_is_none_bool
312 \bool_new:N \g_@@_next_color_is_none_bool

313 \bool_new:N \g_@@_rowcolor_inside_bool

```

10.2.3 Detected commands

There are four keys for “detected commands and environments”: `detected-commands`, `raw-detected-commands`, `beamer-commands` and `beamer-environments`.

For each of those keys, we keep aclist of the names of such detected commands and environments. For the commands, the corresponding `clist` will contain the name of the commands *without* the backlash.

```

314 \clist_new:N \l_@@_detected_commands_clist
315 \clist_new:N \l_@@_raw_detected_commands_clist
316 \clist_new:N \l_@@_beamer_commands_clist
317 \clist_set:Nn \l_@@_beamer_commands_clist
318 { uncover, only , visible , invisible , alert , action}
319 \clist_new:N \l_@@_beamer_environments_clist
320 \clist_set:Nn \l_@@_beamer_environments_clist
321 { uncoverenv , onlyenv , visibleenv , invisibleenv , alertenv , actionenv }

```

Remark that, since we have used clists, these clists, as token lists are “purified”: there is no empty component and for each component, there is no space on both sides.

Of course, the value of those clists may be modified during the preamble of the document by using the corresponding key ('detected-commands', etc.).

However, after the `\begin{document}`, it's no longer possible to modify those clists because their contents will be used in the construction of the main LPEG for each computer language.

However, in a `\AtBeginDocument`, we will convert those clists into “toks registers” of TeX.

```

322 \hook_gput_code:nnn { begindocument } { . }
323 {
324   \newtoks \PitonDetectedCommands
325   \newtoks \PitonRawDetectedCommands
326   \newtoks \PitonBeamerCommands
327   \newtoks \PitonBeamerEnvironments

```

L3 does *not* support those “toks registers” but it's still possible to affect to the “toks registers” the content of the clists with a L3-like syntax.

```

328 \exp_args:NV \PitonDetectedCommands \l_@@_detected_commands_clist
329 \exp_args:NV \PitonRawDetectedCommands \l_@@_raw_detected_commands_clist
330 \exp_args:NV \PitonBeamerCommands \l_@@_beamer_commands_clist
331 \exp_args:NV \PitonBeamerEnvironments \l_@@_beamer_environments_clist
332 }

```

Then at the beginning of the document, when we will load the Lua file `piton.lua`, we will read those “toks registers” within Lua (with `tex.toks`) and convert them into Lua tables (and, then, use those tables to construct LPEG).

When the key `vertical-detected-commands` is used, we will have to redefine the corresponding commands in `\@@_pre_composition:`.

The instructions for these redefinitions will be put in the following token list.

```
333 \tl_new:N \g_@@_def_vertical_commands_tl
```

```

334 \cs_new_protected:Npn \@@_vertical_commands:n #1
335 {
336   \clist_put_right:Nn \l_@@_raw_detected_commands_clist { #1 }
337   \clist_map_inline:nn { #1 }
338   {
339     \cs_set_eq:cc { @@ _ old _ ##1 : } { ##1 }
340     \cs_new_protected:cn { @@ _ new _ ##1 : n }
341   {
342     \bool_if:nTF
343       { \l_@@_tcolorbox_bool || ! \str_if_empty_p:N \l_@@_box_str }
344     {
345       \tl_gput_right:Nn \g_@@_after_line_tl
346         { \use:c { @@ _old _ ##1 : } { #####1 } }
347     }
348   {
349     \cs_if_exist:cTF { g_@@_after_line _ \int_use:N \g_@@_line_int _ tl }
350       { \tl_gput_right:cn }
351       { \tl_gset:cn }
352       { g_@@_after_line _ \int_eval:n { \g_@@_line_int + 1 } _ tl }
353       { \use:c { @@ _old _ ##1 : } { #####1 } }
354     }
355   }
356   \tl_gput_right:Nn \g_@@_def_vertical_commands_tl
357     { \cs_set_eq:cc { ##1 } { @@ _ new _ ##1 : n } }
358 }
359 }
```

10.2.4 Treatment of a line of code

```

360 \cs_new_protected:Npn \@@_replace_spaces:n #1
361 {
362   \tl_set:Nn \l_tmpa_tl { #1 }
363   \bool_if:NTF \l_@@_show_spaces_bool
364   {
365     \tl_set:Nn \l_@@_space_in_string_tl { \u{20} } % U+2423
366     \tl_replace_all:NVn \l_tmpa_tl \c_catcode_other_space_tl { \u{20} } % U+2423
367   }
368 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```

369 \bool_if:NT \l_@@_break_lines_in_Piton_bool
370   {
371     \tl_if_eq:NnF \l_@@_space_in_string_tl { \u{20} }
372       { \tl_set_eq:NN \l_@@_space_in_string_tl \@@_breakable_space: }
```

In the following code, we have to replace all the spaces in the token list `\l_tmpa_tl`. That means that this replacement must be “recursive”: even the spaces which are within brace groups (`{...}`) must be replaced. For instance, the spaces in long strings of Python are within such groups since there are within a command `\PitonStyle{String.Long}{...}`. That’s why the use of `\tl_replace_all:Nnn` is not enough.

The first implementation was using `\regex_replace_all:nnN`
`\regex_replace_all:nnN { \x20 } { \c { @@_breakable_space: } } \l_tmpa_tl`
but that programmation was certainly slow.

Now, we use `\tl_replace_all:NVn` but, in the styles `String.Long.Internal` we replace the spaces with `\@@_breakable_space:` by another use of the same technic with `\tl_replace_all:NVn`. We do the same job for the *doc strings* of Python and for the comments.

```

373   \tl_replace_all:NVn \l_tmpa_tl
374     \c_catcode_other_space_tl
375     \@@_breakable_space:
```

```

376         }
377     }
378     \l_tmpa_t1
379 }
380 \cs_generate_variant:Nn \@@_replace_spaces:n { o }

```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`.

`\@@_begin_line:` is a TeX command with a delimited argument (`\@@_end_line:` is the marker for the end of the argument).

However, we define also `\@@_end_line:` as no-op, because, when the last line of the listing is the end of an environment of Beamer (eg `\end{uncoverenv}`), we will have a token `\@@_end_line:` added at the end without any corresponding `\@@_begin_line:`).

```
381 \cs_set_protected:Npn \@@_end_line: { }
```

```

382 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
383 {
384     \group_begin:
385     \g_@@_before_line_t1
386     \int_gzero:N \g_@@_indentation_int

```

We put the potential number of line, the potential left margin and the potential background.

```

387 \hbox_set:Nn \l_@@_line_box
388 {
389     \skip_horizontal:N \l_@@_left_margin_dim
390     \bool_if:NT \l_@@_line_numbers_bool
391     {

```

`\l_tmpa_int` will be equal to 1 when the current line is not empty.

```

392     \int_set:Nn \l_tmpa_int
393     {
394         \lua_now:e
395         {
396             tex.sprint
397             (
398                 luatexbase.catcodetables.expl ,

```

Since the argument of `tostring` will be a integer of Lua (`integer` is a sub-type of `number` introduced in Lua 5.3), the output will be of the form "3" (and not "3.0") which is what we want for `\int_set:Nn`.

```

399         tostring
400             ( piton.empty_lines
401                 [ \int_eval:n { \g_@@_line_int + 1 } ]
402             )
403             )
404         }
405     }
406     \bool_lazy_or:nnT
407     { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
408     { ! \l_@@_skip_empty_lines_bool }
409     { \int_gincr:N \g_@@_visual_line_int }
410     \bool_lazy_or:nnT
411     { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
412     { ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool }
413     { \@@_print_number: }
414   }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

415     \bool_if:NT \g_@@_bg_bool
416     {
... but if only if the key left-margin is not used !
417         \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
418         { \skip_horizontal:n { 0.5 em } }
419     }

```

```

420 \bool_if:NTF \l_@@_minimize_width_bool
421 {
422     \hbox_set:Nn \l_tmpa_box
423     {
424         \language = -1
425         \raggedright
426         \strut
427         \@@_replace_spaces:n { #1 }
428         \strut \hfil
429     }
430     \dim_compare:nNnTF { \box_wd:N \l_tmpa_box } < \l_@@_code_width_dim
431     { \box_use:N \l_tmpa_box }
432     { \@@_vtop_of_code:n { #1 } }
433 }
434 { \@@_vtop_of_code:n { #1 } }
435 }

```

Now, the line of code is composed in the box `\l_@@_line_box`.

```

436 \box_set_dp:Nn \l_@@_line_box { \box_dp:N \l_@@_line_box + 1.25 pt }
437 \box_set_ht:Nn \l_@@_line_box { \box_ht:N \l_@@_line_box + 1.25 pt }
438 \dim_gset_eq:NN \g_@@_width_dim \l_@@_width_dim
439 \box_use_drop:N \l_@@_line_box
440 \group_end:
441 \g_@@_after_line_tl
442 \tl_gclear:N \g_@@_after_line_tl
443 \tl_gclear:N \g_@@_before_line_tl
444 }

445 \cs_new_protected:Npn \@@_vtop_of_code:n #1
446 {
447     \vbox_top:n
448     {
449         \hsize = \l_@@_code_width_dim
450         \language = -1
451         \raggedright
452         \strut
453         \@@_replace_spaces:n { #1 }
454         \strut \hfil
455     }
456 }

```

Of course, the following command will be used when the key `background-color` is used.

The content of the line has been previously set in `\l_@@_line_box`.

```

457 \cs_new_protected:Npn \@@_add_background_to_line_and_use:
458 {
459     \vtop
460     {
461         \offinterlineskip
462         \hbox
463         {

```

The command `\@@_compute_and_set_color:` sets the current color but also sets the booleans `\g_@@_color_is_none_bool` and `\g_@@_next_color_is_none_bool`. It uses the current value of `\l_@@_bg_color_clist`, the value of `\g_@@_line_int` (the number of the current line) but also potential token lists of the form `\g_@@_color_12_tl` if the final user has used the command `\rowcolor`.

```
464     \@@_compute_and_set_color:
```

The colored panels are overlapping. However, if the special color `none` is used we must not put such overlapping.

```

465     \dim_set:Nn \l_tmpa_dim { \box_dp:N \l_@@_line_box }
466     \bool_if:NT \g_@@_next_color_is_none_bool
467     { \dim_sub:Nn \l_tmpa_dim { 2.5 pt } }
```

When `\g_@@_color_is_none_bool` is in force, we will compose a `\vrule` of width 0 pt. We need that `\vrule` because it will be a strut.

```

468     \bool_if:NTF \g_@@_color_is_none_bool
469         { \dim_zero:N \l_tmpb_dim }
470         { \dim_set_eq:NN \l_tmpb_dim \g_@@_width_dim }
471     \dim_set:Nn \l_@@_tmpc_dim { \box_ht:N \l_@@_line_box }
```

Now, the colored panel.

```

472     \dim_compare:nNnTF \l_@@_rounded_corners_dim > \c_zero_dim
473     {
474         \int_compare:nNnTF \g_@@_line_int = \c_one_int
475         {
476             \begin{tikzpicture}[baseline = 0cm]
477                 \fill (0,0)
478                     [rounded-corners = \l_@@_rounded_corners_dim]
479                     -- (0,\l_@@_tmpc_dim)
480                     -- (\l_tmpb_dim,\l_@@_tmpc_dim)
481                     [sharp-corners] -- (\l_tmpb_dim,-\l_tmpa_dim)
482                     -- (0,-\l_tmpa_dim)
483                     -- cycle ;

516 }
```

The command `\@@_compute_and_set_color:` sets the current color but also sets the booleans `\g_@@_color_is_none_bool` and `\g_@@_next_color_is_none_bool`. It uses the current value of `\l_@@_bg_color_clist`, the value of `\g_@@_line_int` (the number of the current line) but also potential token lists of the form `\g_@@_color_12_t1` if the final user has used the command `\rowcolor`.

```

517 \cs_set_protected:Npn \@@_compute_and_set_color:
518     {
519         \int_compare:nNnTF \l_@@_bg_colors_int = \c_zero_int
520             { \tl_set:Nn \l_tmpa_tl { none } }
521             {
522                 \int_set:Nn \l_tmpb_int
```

```

523     { \int_mod:nn \g_@@_line_int \l_@@_bg_colors_int + 1 }
524     \tl_set:Ne \l_tmpa_tl { \clist_item:Nn \l_@@_bg_color_clist \l_tmpb_int }
525 }

```

The row may have a color specified by the command `\rowcolor`. We check that point now.

```

526 \cs_if_exist:cT { g_@@_color_ \int_use:N \g_@@_line_int _ tl }
527 {
528     \tl_set_eq:Nc \l_tmpa_tl { g_@@_color_ \int_use:N \g_@@_line_int _ tl }

```

We don't need any longer the variable and that's why we delete it (it must be free for the next environment of piton).

```

529     \cs_undefine:c { g_@@_color_ \int_use:N \g_@@_line_int _ tl }
530 }
531 \tl_if_eq:NnTF \l_tmpa_tl { none }
532 {
533     \bool_gset_true:N \g_@@_color_is_none_bool
534     \bool_gset_false:N \g_@@_color_is_none_bool
535     @@@_color:o \l_tmpa_tl
536 }

```

We are looking for the next color because we have to know whether that color is the special color `none` (for the vertical adjustment of the background color).

```

537 \int_compare:nNnTF { \g_@@_line_int + 1 } = \g_@@_nb_lines_int

556         \bool_gset_false:N \g_@@_next_color_is_none_bool
557     }
558 }

```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

557 \cs_set_protected:Npn \@@_color:n #1
558 {
559     \tl_if_head_eq_meaning:nNTF { #1 } [
560     {
561         \tl_set:Nn \l_tmpa_tl { #1 }
562         \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
563         \exp_last_unbraced:No \color \l_tmpa_tl
564     }
565     { \color { #1 } }
566 }
567 \cs_generate_variant:Nn \@@_color:n { o }

```

The command `\@@_par:` will be inserted by Lua between two lines of the informatic listing.

- In fact, it will be inserted between two commands `\@@_begin_line:... \@@_end_of_line::`
- When the key `break-lines-in-Piton` is in force, a line of the computer listing (the *input*) may result in several lines in the PDF (the *output*).
- Remind that `\@@_par:` has a rather complex behaviour because it will finish and start paragraphs.

```

568 \cs_new_protected:Npn \@@_par:
569 {

```

We recall that `\g_@@_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```

570     \int_gincr:N \g_@@_line_int

```

... it will be used to allow or disallow page breaks.

Each line in the listing is composed in a box of TeX (which may contain several lines when the key `break-lines-in-Piton` is in force) put in a paragraph.

```

571     \par

```

We now add a `\kern` because each line of code is overlapping vertically by a quantity of 2.5 pt in order to have a good background (when `background-color` is in force). We need to use a `\kern` (in fact `\par\kern...`) and not a `\vskip` because page breaks should *not* be allowed on that kern.

```

572     \kern -2.5 pt

```

Now, we control page breaks after the paragraph.

```

573     \@@_add_penalty_for_the_line:
574 }

```

After the command `\@@_par:`, we will usually have a command `\@@_begin_line::`.

The following command `\@@_breakable_space:` is for breakable spaces in the environments `{Piton}` and the listings of `\PitonInputFile` and *not* for the commands `\piton`.

```

575 \cs_set_protected:Npn \@@_breakable_space:
576 {
577     \discretionary
578     { \hbox:n { \color { gray } \l_@@_end_of_broken_line_tl } }

932   \keys_set:nn { PitonOptions } { #1 }
933   \bool_set_false:N \l_@@_in_PitonOptions_bool
934 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

935 \NewDocumentCommand \@@_fake_PitonOptions { }
936   { \keys_set:nn { PitonOptions } }

```

10.2.6 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```

937 \int_new:N \g_@@_visual_line_int
938 \cs_new_protected:Npn \@@_incr_visual_line:
939 {
940   \bool_if:NF \l_@@_skip_empty_lines_bool
941     { \int_gincr:N \g_@@_visual_line_int }
942 }

943 \cs_new_protected:Npn \@@_print_number:
944 {
945   \hbox_overlap_left:n
946   {
947     {
948       \l_@@_line_numbers_format_tl

```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```

949   { \int_to_arabic:n \g_@@_visual_line_int }
950   }
951   \skip_horizontal:N \l_@@_numbers_sep_dim
952 }
953 }

```

10.2.7 The main commands and environments for the final user

```

954 \NewDocumentCommand { \NewPitonLanguage } { o { } m ! o }
955   {
956     \tl_if_novalue:nTF { #3 }

```

The last argument is provided by currying.

```

957   { \@@_NewPitonLanguage:nnn { #1 } { #2 } }

```

The two last arguments are provided by currying.

```

958   { \@@_NewPitonLanguage:nnnnn { #1 } { #2 } { #3 } }
959 }

```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```

960 \prop_new:N \g_@@_languages_prop

```

```

961 \keys_define:nn { NewPitonLanguage }
962   {
963     morekeywords .code:n = ,
964     otherkeywords .code:n = ,
965     sensitive .code:n = ,
966     keywordsprefix .code:n = ,
967     moretexcs .code:n = ,
968     morestring .code:n = ,
969     morecomment .code:n = ,
970     moredelim .code:n = ,
971     moredirectives .code:n = ,
972     tag .code:n = ,
973     alsodigit .code:n = ,
974     alsoletter .code:n = ,
975     alsoother .code:n = ,
976     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
977 }

```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```

978 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
979   {

```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : [AspectJ]{Java}. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```

980   \tl_set:Ne \l_tmpa_tl
981   {
982     \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
983     \str_lowercase:n { #2 }
984   }

```

The following set of keys is only used to raise an error when a key is unknown!

```

985 \keys_set:nn { NewPitonLanguage } { #3 }

```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```

986 \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }

```

The Lua part of the package piton will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the use of the Lua function `piton.new_language` (which does the main job).

```

987 \@@_NewPitonLanguage:on \l_tmpa_tl { #3 }
988 }
989 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
990   {
991     \hook_gput_code:nnn { begindocument } { . }
992     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }

```

```

993     }
994 \cs_generate_variant:Nn \@@_NewPitonLanguage:nn { o }

```

Now the case when the language is defined upon a base language.

```

995 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
996 {

```

We store in `\l_tmpa_t1` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{C}{...}`

```

997 \tl_set:Ne \l_tmpa_t1
998 {
999     \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
1000     \str_lowercase:n { #4 }
1001 }

```

We retrieve in `\l_tmpb_t1` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by piton but only those defined by using `\NewPitonLanguage`.

```

1002 \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_t1 \l_tmpb_t1

```

We can now define the new language by using the previous function.

```

1003 { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_t1 }
1004 { \@@_error:n { Language-not-defined } }
1005 }

```

```

1006 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4

```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```

1007 { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
1008 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }

```

```

1009 \NewDocumentCommand { \piton } { }
1010 { \peek_meaning:NTF \bgroup { \@@_piton_standard } { \@@_piton_verbatim } }
1011 \NewDocumentCommand { \@@_piton_standard } { m }
1012 {
1013     \group_begin:
1014     \tl_if_eq:NnF \l_@@_space_in_string_t1 { \u }
1015     {

```

Remind that, when `break-strings-anywhere` is in force, multiple commands `\-` will be inserted between the characters of the string to allow the breaks. The `\exp_not:N` before `\space` is mandatory.

```

1016 \bool_lazy_or:nnT
1017     \l_@@_break_lines_in_piton_bool
1018     \l_@@_break_strings_anywhere_bool
1019     { \tl_set:Nn \l_@@_space_in_string_t1 { \exp_not:N \space } }
1020 }

```

The following tuning of LuaTeX in order to avoid all breaks of lines on the hyphens.

```

1021 \automatichyphenmode = 1

```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Ne` below) and that's why we can provide the following escapes to the final user:

```

1022 \cs_set_eq:NN \\ \c_backslash_str
1023 \cs_set_eq:NN \% \c_percent_str
1024 \cs_set_eq:NN \{ \c_left_brace_str
1025 \cs_set_eq:NN \} \c_right_brace_str
1026 \cs_set_eq:NN \$ \c_dollar_str

```

The standard command `\u` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```

1027 \cs_set_eq:cN { ~ } \space
1028 \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
1029 \tl_set:Ne \l_tmpa_t1

```

```

1030     {
1031         \lua_now:e
1032             { piton.ParseBis('\l_piton_language_str',token.scan_string()) }
1033             { #1 }
1034     }
1035 \bool_if:NTF \l_@@_show_spaces_bool
1036     { \tl_replace_all:NVN \l_tmpa_tl \c_catcode_other_space_tl { \ } } % U+2423
1037     {
1038         \bool_if:NT \l_@@_break_lines_in_piton_bool

```

With the following line, the spaces of catacode 12 (which were not breakable) are replaced by `\space`, and, thus, become breakable.

```

1039     { \tl_replace_all:NVN \l_tmpa_tl \c_catcode_other_space_tl \space }
1040 }

```

The command `\text` is provided by the package `amstext` (loaded by `piton`).

```

1041 \if_mode_math:
1042     \text { \l_@@_font_command_tl \l_tmpa_tl }
1043 \else:
1044     \l_@@_font_command_tl \l_tmpa_tl
1045 \fi:
1046 \group_end:
1047 }

1048 \NewDocumentCommand { \@@_piton_verbatim } { v }
1049 {
1050     \group_begin:
1051     \automatichyphenmode = 1
1052     \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
1053     \tl_set:Ne \l_tmpa_tl
1054     {
1055         \lua_now:e
1056             { piton.Parse('\l_piton_language_str',token.scan_string()) }
1057             { #1 }
1058     }
1059     \bool_if:NT \l_@@_show_spaces_bool
1060     { \tl_replace_all:NVN \l_tmpa_tl \c_catcode_other_space_tl { \ } } % U+2423

1121     \l_@@_font_command_tl
1122 }

```

If the final user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`. The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

1123 \cs_new_protected:Npn \@@_compute_left_margin:nn #1 #2
1124 {
1125     \bool_lazy_and:nnT \l_@@_left_margin_auto_bool \l_@@_line_numbers_bool
1126     {
1127         \hbox_set:Nn \l_tmpa_box
1128         {
1129             \l_@@_line_numbers_format_tl
1130             \bool_if:NTF \l_@@_skip_empty_lines_bool
1131             {
1132                 \lua_now:n
1133                     { piton.#1(token.scan_argument()) }
1134                     { #2 }
1135                 \int_to_arabic:n
1136                     { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
1137             }

```

```

1138     {
1139         \int_to_arabic:n
1140             { \g_@@_visual_line_int + \g_@@_nb_lines_int }
1141     }
1142     }
1143     \dim_set:Nn \l_@@_left_margin_dim
1144         { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
1145     }
1146 }
1147 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

The following command computes `\g_@@_width_dim` and it will be used when `max-width` or `width=min` is used.

```

1148 \cs_new_protected:Npn \@@_compute_width:
1149 {
1150     \dim_gset:Nn \g_@@_width_dim { \box_wd:N \g_@@_output_box }
1151     \bool_if:NTF \g_@@_bg_bool
1152     {
1153         \dim_gadd:Nn \g_@@_width_dim { 0.5 em }
1154         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
1155             { \dim_gadd:Nn \g_@@_width_dim { 0.5 em } }
1156             { \dim_gadd:Nn \g_@@_width_dim \l_@@_left_margin_dim }
1157     }
1158     { \dim_gadd:Nn \g_@@_width_dim \l_@@_left_margin_dim }
1159 }

```

Whereas `\l_@@_width_dim` is the width of the environment as specified by the key `width` (except when `max-width` or `width=min` is used), `\l_@@_code_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background.

```

1160 \cs_new_protected:Npn \@@_compute_code_width:
1161 {
1162     \dim_set_eq:NN \l_@@_code_width_dim \l_@@_width_dim
1163     \bool_if:NTF \g_@@_bg_bool

```

If there is a background, we subtract 0.5 em for the margin on the right.

```

1164 {
1165     \dim_sub:Nn \l_@@_code_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value³⁶ and we use that value. Elsewhere, we use a value of 0.5 em.

```

1166     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
1167         { \dim_sub:Nn \l_@@_code_width_dim { 0.5 em } }
1168         { \dim_sub:Nn \l_@@_code_width_dim \l_@@_left_margin_dim }
1169     }

```

If there is no background, we only subtract the left margin.

```

1170     { \dim_sub:Nn \l_@@_code_width_dim \l_@@_left_margin_dim }
1171 }

```

For the following commands, the arguments are provided by curryfication.

```

1172 \NewDocumentCommand { \NewPitonEnvironment } { }
1173     { \@@_DefinePitonEnvironment:nmmmn { New } }
1174 \NewDocumentCommand { \DeclarePitonEnvironment } { }
1175     { \@@_DefinePitonEnvironment:nmmnn { Declare } }
1176 \NewDocumentCommand { \RenewPitonEnvironment } { }
1177     { \@@_DefinePitonEnvironment:nmmnn { Renew } }
1178 \NewDocumentCommand { \ProvidePitonEnvironment } { }
1179     { \@@_DefinePitonEnvironment:nmmnn { Provide } }

```

³⁶If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

The first argument of the following macro is one of the four strings: `New`, `Renew`, `Provide` and `Declare`.

```
1180 \cs_new_protected:Npn \@@_DefinePitonEnvironment:nnnnn #1 #2 #3 #4 #5
1181 {
```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```
1182 \use:x
1183 {
1184     \cs_set_protected:Npn
1185         \use:c { _@@_collect_ #2 :w }
1186         ####1
1187         \c_backslash_str end \c_left_brace_str #2 \c_right_brace_str
1188     }
1189     {
1190         \group_end:
```

Maybe, we should deactivate all the “shorthands” of `babel` (when `babel` is loaded) with the following instruction:

```
\IfPackageLoadedT { babel } { \languageshorthands { none } }
```

But we should be sure that there is no consequence in the LaTeX comments...

```
1191         \tl_set:Nn \l_@@_listing_tl { ##1 }
1192         \@@_composition:
1193 % \end{macrocode}
1194 %
1195 % The following |\end{#2}| is only for the stack of environments of LaTeX.
1196 % \begin{macrocode}
1197         \end { #2 }
1198     }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment`...

```
1199 \use:c { #1 DocumentEnvironment } { #2 } { #3 }
1200 {
1201     \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
1202     #4
1203     \@@_pre_composition:
1204     \int_compare:nNnT { \l_@@_number_lines_start_int } > { \c_zero_int }
1205     { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
1206     \group_begin:
1207     \tl_map_function:nN
1208         { \ \\ \{ \} \$ \& \# \^ \_ \% \~ \^\I }
1209         \char_set_catcode_other:N
1210         \use:c { _@@_collect_ #2 :w }
1211     }
1212     {
1213         #5
1214         \ignorespacesafterend
1215     }
```

The following code is for technical reasons. We want to change the catcode of `\^\I` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `\^\I` is converted to space).

```
1216     \AddToHook { env / #2 / begin } { \char_set_catcode_other:N \^\I }
1217 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

```
1218 \IfFormatAtLeastTF { 2025-06-01 }
1219 {
```

We will retrieve the body of the environment in `\l_@@_listing_tl`.

```

1220 \cs_new_protected:Npn \@@_store_body:n #1
1221 {

```

Now, we have to replace all the occurrences of `\obeyedline` by a character of end of line (`\r` in the strings of Lua).

```

1222     \tl_set:Ne \obeyedline { \char_generate:nn { 13 } { 11 } }
1223     \tl_set:Ne \l_@@_listing_tl { #1 }
1224     \tl_set_eq:NN \ProcessedArgument \l_@@_listing_tl
1225 }

```

The first argument of the following macro is one of the four strings: New, Renew, Provide and Declare.

```

1226 \cs_set_protected:Npn \@@_DefinePitonEnvironment:nnnn #1 #2 #3 #4 #5
1227 {
1228     \use:c { #1 DocumentEnvironment } { #2 } { #3 > { \@@_store_body:n } c }
1229     {
1230         \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
1231         #4
1232         \@@_pre_composition:
1233         \int_compare:nNnT { \l_@@_number_lines_start_int } > { \c_zero_int }
1234         {
1235             \int_gset:Nn \g_@@_visual_line_int
1236             { \l_@@_number_lines_start_int - 1 }
1237         }

```

Now, the main job.

```

1238     \bool_if:NT \g_@@_footnote_bool \savenotes
1239     \@@_composition:
1240     \bool_if:NT \g_@@_footnote_bool \endsavenotes
1241     #5
1242     }
1243     { \ignorespacesafterend }
1244 }
1245 }
1246 {
1247 \cs_new_protected:Npn \@@_composition:
1248 {
1249     \str_if_empty:NT \l_@@_box_str
1250     {
1251         \mode_if_vertical:F
1252         { \bool_if:NF \l_@@_in_PitonInputFile_bool { \newline } }
1253     }

```

The following line is only to compute `\l_@@_lines_int` which will be used only when both `left-margin=auto` and `skip-empty-lines = false` are in force. We should change that.

```

1254     \lua_now:e { piton.CountLines ( '\lua_escape:n{\l_@@_listing_tl}' ) }

```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

1255 \@@_compute_left_margin:no { CountNonEmptyLines } { \l_@@_listing_tl }
1256 \lua_now:e
1257 {
1258     piton.join = "\l_@@_join_str"
1259     piton.write = "\l_@@_write_str"
1260     piton.path_write = "\l_@@_path_write_str"
1261 }
1262 \noindent
1263 \bool_if:NTF \l_@@_print_bool
1264 {

```

When `split-on-empty-lines` is in force, each chunk will be formated by an environment `{Piton}` (or the environment specified by `env-used-by-split`). Within each of these environments, we will come back here (but, of course, `split-on-empty-line` will have been set to `false`).

```

1265     \bool_if:NTF \l_@@_split_on_empty_lines_bool
1266     { \par \@@_retrieve_gobble_split_parse:o \l_@@_listing_tl }
1267     {
1268         \@@_create_output_box:

```

Now, the listing has been composed in `\g_@@_output_box` and `\g_@@_width_dim` contains the width of the listing (with the potential margin for the numbers of lines).

```

1269     \bool_if:NTF \l_@@_tcolorbox_bool
1270     {
1271         \str_if_empty:NTF \l_@@_box_str
1272         { \g_@@_composition_iii: }
1273         { \g_@@_composition_iv: }
1274     }
1275     {
1276         \str_if_empty:NTF \l_@@_box_str
1277         { \g_@@_composition_i: }
1278         { \g_@@_composition_ii: }
1279     }
1280 }
1281 }
1282 { \gobble_parse_no_print:o \l_@@_listing_tl }
1283 }
```

`\g_@@_composition_i:` is for the main case: the key `tcolorbox` is not used, nor the key `box`. We can't do a mere `\vbox_unpack:N \g_@@_output_box` because that would not work inside a list of LaTeX (`{itemize}` or `{enumerate}`).

The composition in the box `\g_@@_output_box` was mandatory to be able to deal with the case of a conjunction of the keys `width=min` and `background-color=....`

```

1284 \cs_new_protected:Npn \g_@@_composition_i:
1285 {
```

First, we “reverse” the box `\g_@@_output_box`: we put in the box `\g_tmpa_box` the boxes present in `\g_@@_output_box`, but in reversed order. The vertical spaces and the penalties are discarded.

```
1286 \box_clear:N \g_tmpa_box
```

The box `\g_@@_line_box` will be used as an auxiliary box.

```
1287 \box_clear_new:N \g_@@_line_box
```

We unpack `\g_@@_output_box` in `\l_tmpa_box` used as a scratched box.

```

1288 \vbox_set:Nn \l_tmpa_box
1289 {
1290     \vbox_unpack_drop:N \g_@@_output_box
1291     \bool_gset_false:N \g_tmpa_bool
1292     \unskip \unskip
1293     \bool_gset_false:N \g_tmpa_bool
1294     \bool_do_until:nn \g_tmpa_bool
1295     {
1296         \unskip \unskip \unskip
1297         \unpenalty \unkern
1298         \box_set_to_last:N \l_@@_line_box
1299         \box_if_empty:NTF \l_@@_line_box
1300             { \bool_gset_true:N \g_tmpa_bool }
1301             {
1302                 \vbox_gset:Nn \g_tmpa_box
1303                 {
1304                     \vbox_unpack:N \g_tmpa_box
1305                     \box_use:N \l_@@_line_box
1306                 }
1307             }
1308         }
1309     }
```

Now, we will loop over the boxes in `\g_tmpa_box` and compose the boxes in the TeX flow.

```

1310     \bool_gset_false:N \g_tmpa_bool
1311     \int_zero:N \g_@@_line_int
1312     \bool_do_until:nn \g_tmpa_bool
1313     {
```

We retrieve the last box of `\g_tmpa_box` (and store it in `\g_@@_line_box`) and keep the other boxes in `\g_tmpa_box`.

```
1314     \vbox_gset:Nn \g_tmpa_box
```

```

1315     {
1316         \vbox_unpack_drop:N \g_tmpa_box
1317         \box_gset_to_last:N \g_@@_line_box
1318     }

```

If the box that we have retrieved is void, that means that, in fact, there is no longer boxes in `\g_tmpa_box` and we will exit the loop.

```

1319     \box_if_empty:NTF \g_@@_line_box
1320     { \bool_gset_true:N \g_tmpa_box }
1321     {
1322         \box_use:N \g_@@_line_box
1323         \int_gincr:N \g_@@_line_int
1324         \par
1325         \kern -2.5 pt

```

We will determine the penalty by reading the Lua table `piton.lines_status`. That will use the current value of `\g_@@_line_int`.

```
1326     \@@_add_penalty_for_the_line:
```

We now add the instructions corresponding to the *vertical detected commands* that are potentially used in the corresponding line of the listing.

```

1327     \cs_if_exist_use:cT { g_@@_after_line _ \int_use:N \g_@@_line_int _ tl }
1328     { \cs_undefine:c { g_@@_after_line _ \int_use:N \g_@@_line_int _ tl } }
1329     \mode_leave_vertical:
1330 }
1331 }
1332 }

```

`\@@_composition_ii`: will be used when the key `box` is in force.

```

1333 \cs_new_protected:Npn \@@_composition_ii:
1334 {

```

It will be possible to delete the `\exp_not:N` in TeXLive 2025 because `\begin` is now protected by `\protected` (and not by `\protect`).

```

We have, when break-lines-in-Piton is in force, to replace the spaces by \@@_breakable_space: because, when we have done a similar job in \@@_replace_spaces:n used in \@@_begin_line:, that job was not able to do the replacement in the brace group {...} of \PitonStyle{String.Long}{...} because we used a \tl_replace_all:NVn. At that time, it would have been possible to use a \tl_regex_replace_all:Nnn but it is notoriously slow.

1807     Name.Constructor   = \color [ HTML ] { 006000 } \bfseries ,
1808     Name.Field         = \color [ HTML ] { AA6600 } ,
1809     Name.Module        = \color [ HTML ] { 0060A0 } \bfseries ,
1810     Name.Table         = \color [ HTML ] { 309030 } ,
1811     Number            = \color [ HTML ] { FF6600 } ,
1812     Number.Internal    = \@@_number:n ,
1813     Operator          = \color [ HTML ] { 555555 } ,
1814     Operator.Word      = \bfseries ,
1815     String             = \color [ HTML ] { CC3300 } ,
1816     String.Long.Internal = \@@_string_long:n ,
1817     String.Short.Internal = \@@_string_short:n ,
1818     String.Doc.Internal = \@@_string_doc:n ,
1819     String.Doc          = \color [ HTML ] { CC3300 } \itshape ,
1820     String.Interpol     = \color [ HTML ] { AA0000 } ,
1821     Comment.LaTeX       = \normalfont \color [ rgb ] { .468, .532, .6 } ,
1822     Name.Type           = \color [ HTML ] { 336666 } ,

```

```

1823 InitialValues      = \@@_piton:n ,
1824 Interpol.Inside    = { \l_@@_font_command_tl \@@_piton:n } ,
1825 TypeParameter      = \color [ HTML ] { 336666} \itshape ,
1826 Preproc             = \color [ HTML ] { AA6600} \slshape ,

```

We need the command `\@@_identifier:n` because of the command `\SetPitonIdentifier`. The command `\@@_identifier:n` will potentially call the style `Identifier` (which is a user-style, not an internal style).

```

1827 Identifier.Internal = \@@_identifier:n ,
1828 Identifier          = ,
1829 Directive           = \color [ HTML ] { AA6600} ,
1830 Tag                 = \colorbox { gray!10 } ,
1831 UserFunction        = \PitonStyle { Identifier } ,
1832 Prompt              = ,
1833 Discard             = \use_none:n
1834 }

```

If the key `math-comments` has been used in the preamble of the LaTeX document, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```

1835 \hook_gput_code:nnn { begindocument } { . }
1836 {
1837   \bool_if:NT \g_@@_math_comments_bool
1838     { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1839 }

```

10.2.10 Highlighting some identifiers

```

1840 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1841 {
1842   \clist_set:Nn \l_tmpa_clist { #2 }
1843   \tl_if_novalue:nTF { #1 }
1844   {
1845     \clist_map_inline:Nn \l_tmpa_clist
1846       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1847   }
1848   {
1849     \str_set:Ne \l_tmpa_str { \str_lowercase:n { #1 } }
1850     \str_if_eq:onT \l_tmpa_str { current-language }
1851       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1852     \clist_map_inline:Nn \l_tmpa_clist
1853       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1854   }
1855 }
1856 \cs_new_protected:Npn \@@_identifier:n #1
1857 {
1858   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1859   {
1860     \cs_if_exist_use:cF { PitonIdentifier _ #1 }
1861       { \PitonStyle { Identifier } }
1862   }
1863   { #1 }
1864 }

```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1865 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
```

```
1866 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1867 { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1868 \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1869 { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1870 \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1871 { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1872 \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```
1873 \seq_if_in:Nf \g_@@_languages_seq { \l_piton_language_str }
1874 { \seq_gput_left:No \g_@@_languages_seq { \l_piton_language_str } }
1875 }
```

```
1876 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1877 {
1878 \tl_if_novalue:nTF { #1 }
```

If the command is used without its optional argument, we will deleted the user language for all the computer languages.

2166                     [[\@@_test_version:n {}] .. piton_version .. "}" )
```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table called `piton`.

```

2169 (*LUA)
2170 piton.comment_latex = piton.comment_latex or ">"
2171 piton.comment_latex = "#" .. piton.comment_latex
```

The table `piton.write_files` will contain the contents of all the files that we will write on the disk in the `\AtEndDocument` (if the user has used the key `write-file`). The table `piton.join_files` is similar for the key `join`.

```

2172 piton.write_files = { }
2173 piton.join_files = { }

2174 local sprintL3
2175 function sprintL3 ( s )
2176     \tex.print ( luatexbase.catcodetablesexpl , s )
2177 end
```

10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```
2178 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc  
2179 local Cg, Cmt, Cb = lpeg.Cg, lpeg.Cmt, lpeg.Cb  
2180 local B, R = lpeg.B, lpeg.R
```

The following line is mandatory.

```
2181 lpeg.locale(lpeg)
```

10.3.2 The functions Q, K, WithStyle, etc.

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the informative listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```
2182 local Q  
2183 function Q ( pattern )  
2184     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )  
2185 end
```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```
2186 local L  
2187 function L ( pattern ) return  
2188     Ct ( C ( pattern ) )  
2189 end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function, unlike the previous one, will be widely used.

```
2190 local Lc  
2191 function Lc ( string ) return  
2192     Cc ( { luatexbase.catcodetables.expl , string } )  
2193 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
2194 e  
2195 local K  
2196 function K ( style , pattern ) return  
2197     Lc ( [[ {\PitonStyle{ }} .. style .. "}{"} )  
2198     * Q ( pattern )  
2199     * Lc "}{"  
2200 end
```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}}{text to format}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
2201 local WithStyle
2202 function WithStyle ( style , pattern ) return
2203     Ct ( Cc "Open" * Cc ( [[{\PitonStyle{}}] .. style .. "}" ) * Cc "}" ) )
2204     * pattern
2205     * Ct ( Cc "Close" )
2206 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```
2207 Escape = P ( false )
2208 EscapeClean = P ( false )
2209 if piton.begin_escape then
2210     Escape =
2211         P ( piton.begin_escape )
2212         * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
2213         * P ( piton.end_escape )
```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```
2214 EscapeClean =
2215     P ( piton.begin_escape )
2216     * ( 1 - P ( piton.end_escape ) ) ^ 1
2217     * P ( piton.end_escape )
2218 end
2219 EscapeMath = P ( false )
2220 if piton.begin_escape_math then
2221     EscapeMath =
2222         P ( piton.begin_escape_math )
2223         * Lc "$"
2224         * L ( ( 1 - P ( piton.end_escape_math ) ) ^ 1 )
2225         * Lc "$"
2226         * P ( piton.end_escape_math )
2227 end
```

The basic syntactic LPEG

```
2228 local alpha , digit = lpeg.alpha , lpeg.digit
2229 local space = P " "
```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because `lpeg` is not Unicode-aware.

```
2230 local letter = alpha + "_" + "â" + "â" + "ç" + "é" + "ê" + "ê" + "ê" + "ê" + "î"
2231             + "ô" + "û" + "û" + "â" + "â" + "ç" + "é" + "ê" + "ê" + "ê"
2232             + "í" + "î" + "ô" + "û" + "û"
2233
2234 local alphanum = letter + digit
```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
2235 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
2236 local Identifier = K ( 'Identifier.Internal' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

The following functions allow to recognize numbers that contains `_` among their digits, for example `1_000_000`, but also floating point numbers, numbers with exponents and numbers with different bases.³⁷

```

2237 local allow_underscores_except_first
2238 function allow_underscores_except_first ( p )
2239     return p * (P "_" + p)^0
2240 end
2241 local allow_underscores
2242 function allow_underscores ( p )
2243     return (P "_" + p)^0
2244 end
2245 local digits_to_number
2246 function digits_to_number(prefix, digits)
2247     -- The edge cases of what is allowed in number litterals is modelled after
2248     -- OCaml numbers, which seems to be the most permissive language
2249     -- in this regard (among C, OCaml, Python & SQL).
2250     return prefix
2251     * allow_underscores_except_first(digits^1)
2252     * (P "." * #(1 - P ".") * allow_underscores(digits))^1
2253     * (S "eE" * S "+-")^-1 * allow_underscores_except_first(digits^1))^1
2254 end

```

Here is the first use of our function K. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated piton style. For example, for the numbers, piton provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function K. By convention, we use single quotes for delimiting the Lua strings which are names of piton styles (but this is only a convention).

```

2255 local Number =
2256   K ( 'Number.Internal' ,
2257       digits_to_number (P "0x" + P "OX", R "af" + R "AF" + digit)
2258       + digits_to_number (P "0o" + P "OO", R "07")
2259       + digits_to_number (P "0b" + P "OB", R "01")
2260       + digits_to_number ( " ", digit )
2261   )

```

We will now define the LPEG Word.

We have a problem in the following LPEG because, obviously, we should adjust the list of symbols with the delimiters of the current language (no?).

```
2262 local lpeg_central = 1 - S " \'\\r[{}]" - digit
```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

2263 if piton.begin_escape then
2264   lpeg_central = lpeg_central - piton.begin_escape
2265 end
2266 if piton.begin_escape_math then
2267   lpeg_central = lpeg_central - piton.begin_escape_math
2268 end
2269 local Word = Q ( lpeg_central ^ 1 )

2270 local Space = Q " " ^ 1
2271
2272 local SkipSpace = Q " " ^ 0
2273
2274 local Punct = Q ( S ",.;!:" )
2275
2276 local Tab = "\t" * Lc [[ \@@_tab: ]]

```

³⁷The edge cases such as

Remember that `\@_leading_space:` does *not* create a space, only an incrementation of the counter `\g @_indentation_int`.

```
2277 local SpaceIndentation = Lc [[ \@_leading_space: ]] * Q " "
2278 local Delim = Q ( S "[({})]" )
```

The following LPEG catches a space (U+0020) and replace it by `\l @_space_in_string_t1`. It will be used in the strings. Usually, `\l @_space_in_string_t1` will contain a space and therefore there won't be any difference. However, when the key `show-spaces-in-strings` is in force, `\l @_space_in_string_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
2279 local SpaceInString = space * Lc [[ \l @_space_in_string_t1 ]]
```

10.3.3 The option 'detected-commands' and al.

We create four Lua tables called `detected_commands`, `raw_detected_commands`, `beamer_commands` and `beamer_environments`.

On the TeX side, the corresponding data have first been stored as clists.

Then, in a `\AtBeginDocument`, they have been converted in “toks registers” of TeX.

Now, on the Lua side, we are able to access to those “toks registers” with the special pseudo-table `tex.toks` of LuaTeX.

Remark that we can safely use `explode('')` to convert such “toks registers” in Lua tables since, in aclist of L3, there is no empty component and, for each component, there is no space on both sides (the `explode` of the Lua of LuaTeX is unable to do itself such purification of the components).

```
2280 local detected_commands = tex.toks.PitonDetectedCommands : explode ( '' )
2281 local raw_detected_commands = tex.toks.PitonRawDetectedCommands : explode ( '' )
2282 local beamer_commands = tex.toks.PitonBeamerCommands : explode ( '' )
2283 local beamer_environments = tex.toks.PitonBeamerEnvironments : explode ( '' )
```

We will also create some LPEG.

According to our conventions, a LPEG with a name in camelCase is a LPEG which doesn't do any capture.

```
2284 local detectedCommands = P ( false )
2285 for _, x in ipairs ( detected_commands ) do
2286   detectedCommands = detectedCommands + P ( "\\" .. x )
2287 end
```

Further, we will have a LPEG called `DetectedCommands` (in PascalCase) which will be a LPEG *with* captures.

```
2288 local rawDetectedCommands = P ( false )
2289 for _, x in ipairs ( raw_detected_commands ) do
2290   rawDetectedCommands = rawDetectedCommands + P ( "\\" .. x )
2291 end
2292 local beamerCommands = P ( false )
2293 for _, x in ipairs ( beamer_commands ) do
2294   beamerCommands = beamerCommands + P ( "\\" .. x )
2295 end
2296 local beamerEnvironments = P ( false )
2297 for _, x in ipairs ( beamer_environments ) do
2298   beamerEnvironments = beamerEnvironments + P ( x )
2299 end
2300 local beamerBeginEnvironments =
2301   ( space ^ 0 *
2302     L
2303     (
2304       P [[\begin{}]] * beamerEnvironments * "}"
2305       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2306     )
2307     * "\r"
2308   ) ^ 0
```

```

2309 local beamerEndEnvironments =
2310   ( space ^ 0 *
2311     L ( P [[\end{}]] * beamerEnvironments * "}" )
2312     * "\r"
2313   ) ^ 0

```

Several tools for the construction of the main LPEG

```

2314 local LPEG0 = { }
2315 local LPEG1 = { }
2316 local LPEG2 = { }
2317 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings). The argument of `Compute_braces` must be a pattern which *does no catching*.

```

2318 local Compute_braces
2319 function Compute_braces ( lpeg_string ) return
2320   P { "E" ,
2321     E =
2322       (
2323         "{" * V "E" * "}"
2324         +
2325         lpeg_string
2326         +
2327         ( 1 - S "{" )
2328       ) ^ 0
2329     }
2330 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures.

```

2331 local Compute_DetectedCommands
2332 function Compute_DetectedCommands ( lang , braces ) return
2333   Ct (
2334     Cc "Open"
2335       * C ( detectedCommands * space ^ 0 * P "{"
2336       * Cc ")"
2337   )
2338   * ( braces
2339     / ( function ( s )
2340       if s ~= '' then return
2341         LPEG1[lang] : match ( s )
2342       end
2343     end )
2344   )
2345   * P "}"
2346   * Ct ( Cc "Close" )
2347 end

2348 local Compute_RawDetectedCommands
2349 function Compute_RawDetectedCommands ( lang , braces ) return
2350   Ct ( C ( rawDetectedCommands * space ^ 0 * P "{" * braces * P "}" ) )
2351 end

2352 local Compute_LPEG_cleaner
2353 function Compute_LPEG_cleaner ( lang , braces ) return
2354   Ct ( ( ( detectedCommands + rawDetectedCommands ) * "{"
2355     * ( braces

```

```

2356         / ( function ( s )
2357             if s ~= '' then return
2358                 LPEG_cleaner[lang] : match ( s )
2359             end
2360         end )
2361     )
2362     * "}"
2363     + EscapeClean
2364     + C ( P ( 1 ) )
2365   ) ^ 0 ) / table.concat
2366 end

```

The following function `ParseAgain` will be used in the definitions of the LPEG of the different computer languages when we will need to *parse again* a small chunk of code. It's a way to avoid the use of a actual *grammar* of LPEG (in a sens, a recursive regular expression).
 Remark that there is no piton style associated to a chunk of code which is analyzed by `ParseAgain`. If we wish a piton style available to the final user (if he wish to format that element with a uniform font instead of an analyze by `ParseAgain`), we have to use `\@@_piton:n`.

```

2367 local ParseAgain
2368 function ParseAgain ( code )
2369     if code ~= '' then return

```

The variable `piton.language` is set in the function `piton.Parse`.

```

2370     LPEG1[piton.language] : match ( code )
2371 end
2372 end

```

Constructions for Beamer If the class `Beamer` is used, some environments and commands of `Beamer` are automatically detected in the listings of `piton`.

```

2373 local Beamer = P ( false )

```

The following Lua function will be used to compute the LPEG `Beamer` for each computer language.
 According to our conventions, the LPEG `Beamer`, with its name in PascalCase does captures.

```

2374 local Compute_Beamer
2375 function Compute_Beamer ( lang , braces )

```

We will compute in `lpeg` the LPEG that we will return.

```

2376 local lpeg = L ( P [[\pause]] * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
2377 lpeg = lpeg +
2378     Ct ( Cc "Open"
2379         * C ( beamerCommands
2380             * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2381             * P "{"
2382         )
2383         * Cc "}"
2384     )
2385     * ( braces /
2386         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2387     * "}"
2388     * Ct ( Cc "Close" )

```

For the command `\alt`, the specification of the overlays (between angular brackets) is mandatory.

```

2389 lpeg = lpeg +
2390     L ( P [[\alt]] * "<" * ( 1 - P ">" ) ^ 0 * ">{"
2391     * ( braces /
2392         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2393     * L ( P "}{")
2394     * ( braces /
2395         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2396     * L ( P "}" )

```

For `\temporal`, the specification of the overlays (between angular brackets) is mandatory.

```

2397  lpeg = lpeg +
2398    L ( P [[\temporal]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
2399    * ( braces
2400      / ( function ( s )
2401        if s ~= '' then return LPEG1[lang] : match ( s ) end end )
2402      * L ( P "}"{")
2403      * ( braces
2404        / ( function ( s )
2405          if s ~= '' then return LPEG1[lang] : match ( s ) end end )
2406      * L ( P "}"{")
2407      * ( braces
2408        / ( function ( s )
2409          if s ~= '' then return LPEG1[lang] : match ( s ) end end )
2410      * L ( P "}" )

```

Now, the environments of Beamer.

```

2411  for _, x in ipairs ( beamer_environments ) do
2412    lpeg = lpeg +
2413      Ct ( Cc "Open"
2414        * C (
2415          P ( [[\begin{}]] .. x .. "}" )
2416          * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2417        )
2418        * Cc ( [[\end{}]] .. x .. "}" )
2419      )
2420    * (
2421      ( ( 1 - P ( [[\end{}]] .. x .. "}" ) ) ^ 0 )
2422      / ( function ( s )
2423        if s ~= '' then return
2424          LPEG1[lang] : match ( s )
2425        end
2426      )
2427    )
2428    * P ( [[\end{}]] .. x .. "}" )
2429    * Ct ( Cc "Close" )
2430  end

```

Now, you can return the value we have computed.

```

2431  return lpeg
2432 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

2433 local CommentMath =
2434   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

EOL There may be empty lines in the transcription of the prompt, *id est* lines of the form ... without space after and that's why we need `P " "` ^ -1 with the ^ -1.

```

2435 local Prompt =
2436   K ( 'Prompt' , ( P ">>>" + "..." ) * P " " ^ -1 )
2437   * Lc [[ \rowcolor {\l_@@_prompt_bg_color_t1} ] ]

```

The following LPEG EOL is for the end of lines.

```

2438 local EOL =
2439   P "\r"
2440   *
2441   (
2442     space ^ 0 * -1
2443     +

```

We recall that each line of the computer listing we have to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`³⁸.

```

2444   Ct (
2445     Cc "EOL"
2446     *
2447     Ct ( Lc [[ \@@_end_line: ]]
2448       * beamerEndEnvironments
2449       *
2450     (

```

If the last line of the listing is the end of an environment of Beamer (eg. `\end{uncoverenv}`), then, we don't open a new line. A token `\@@_end_line:` will be added at the end of the environment but it will be no-op since we have defined the macro `\@@_end_line:` to be no-op (even though it is also used as a marker for the TeX delimited macro `\@@_begin_line:`).

```

2451   -1
2452   +
2453   beamerBeginEnvironments
2454   * Lc [[ \@@_par:\@@_begin_line: ]]
2455   )
2456   )
2457   )
2458   )
2459   * ( SpaceIndentation ^ 0 * # ( 1 - S "\r" ) ) ^ -1

```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

2460 local CommentLaTeX =
2461   P ( piton.comment_latex )
2462   * Lc [[{\PitonStyle{Comment.LaTeX}}{\ignorespaces}]]
2463   * L ( ( 1 - P "\r" ) ^ 0 )
2464   * Lc "}"
2465   * ( EOL + -1 )

```

10.3.4 The language Python

We open a Lua local scope for the language Python (of course, there will be also global definitions).

```

2466 --python Python
2467 do

```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2468 local Operator =
2469   K ( 'Operator' ,
2470     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"
2471     + S "-~+/*%=>&.@/"
2472
2473 local OperatorWord =
2474   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )

```

The keyword `in` in a construction such as “`for i in range(n)`” must be formatted as a keyword and not as an `Operator.Word` and that's why we write the following LPEG `For`.

```

2475 local For = K ( 'Keyword' , P "for" )
2476   * Space
2477   * Identifier
2478   * Space

```

³⁸Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2479          * K ( 'Keyword' , P "in" )

2480
2481 local Keyword =
2482     K ( 'Keyword' ,

2520         "FileNotFoundException" + "InterruptedError" + "IsADirectoryError" +
2521         "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
2522         "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
2523         "RecursionError" )

2524
2525 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
2526     local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
2527     local DefClass =
2528         K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG `ImportAs` is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```

2529 local ImportAs =
2530   K ( 'Keyword' , "import" )
2531   * Space
2532   * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
2533   *
2534     ( Space * K ( 'Keyword' , "as" ) * Space
2535       * K ( 'Name.Namespace' , identifier ) )
2536     +
2537     ( SkipSpace * Q "," * SkipSpace
2538       * K ( 'Name.Namespace' , identifier ) ) ^ 0
2539   )

```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

2540 local FromImport =
2541   K ( 'Keyword' , "from" )
2542   * Space * K ( 'Name.Namespace' , identifier )
2543   * Space * K ( 'Keyword' , "import" )

```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁹ in that interpolation:

`\piton{f'Total price: {total+1:.2f} €'}`

The interpolations beginning by `%` (even though there is more modern techniques now in Python).

```

2544 local PercentInterpol =
2545   K ( 'String.Interpol' ,
2546     P "%"
2547     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
2548     * ( S "-#0 +" ) ^ 0
2549     * ( digit ^ 1 + "*" ) ^ -1
2550     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
2551     * ( S "HLL" ) ^ -1
2552     * S "sdfFeExXorgiGauc%"
2553   )

```

³⁹There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.⁴⁰

```

2554 local SingleShortString =
2555   WithStyle ( 'String.Short.Internal' ,
2556
2557   Q ( P "f'" + "F'" )
2558   *
2559   (
2560     K ( 'String.Interpol' , "{}" )
2561     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )
2562     * Q ( P ":" * ( 1 - S "}:;" ) ^ 0 ) ^ -1
2563     * K ( 'String.Interpol' , "}" )
2564     +
2565     SpaceInString
2566     +
2567     Q ( ( P "\\"' + "\\\\" + "{}" + "}" ) + 1 - S " {}" ) ^ 1 )

2668 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG **DefFunction** which deals with the whole preamble of a function definition (which begins with `def`).

```

2669 local StringDoc =
2670   K ( 'String.Doc.Internal' , P "r" ^ -1 * "\\"\"\"")
2671   * ( K ( 'String.Doc.Internal' , (1 - P "\\"\"\" - "\r" ) ^ 0 ) * EOL
2672     * Tab ^ 0
2673   ) ^ 0
2674   * K ( 'String.Doc.Internal' , ( 1 - P "\\"\"\" - "\r" ) ^ 0 * "\\"\"\"")

```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```

2675 local Comment =
2676   WithStyle
2677   ( 'Comment.Internal' ,
2678     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
2679   )
2680   * ( EOL + -1 )

```

DefFunction The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2681 local expression =
2682   P { "E" ,
2683     E = ( "" * ( P "\\""+ 1 - S "'\r" ) ^ 0 * """
2684     + "\\" * ( P "\\\\" + 1 - S "\\""\r" ) ^ 0 * "\\""
2685     + "{" * V "F" * "}"
2686     + "(" * V "F" * ")"
2687     + "[" * V "F" * "]"
2688     + ( 1 - S "{}()[]\r," ) ^ 0 ,
2689     F = (   "{" * V "F" * "}"
2690     + "(" * V "F" * ")"
2691     + "[" * V "F" * "]"
2692     + ( 1 - S "{}()[]\r''" ) ^ 0
2693   }

```

We will now define a LPEG **Params** that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG `Params` will be used to catch the chunk `a,b,x=10,n:int.`

```

2694 local Params =
2695   P { "E" ,
2696     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2697     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2698     *
2699       K ( 'InitialValues' , "=" * expression )
2700       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2701     ) ^ -1
2702 }
```

The following LPEG `DefFunction` catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

2703 local DefFunction =
2704   K ( 'Keyword' , "def" )
2705   * Space
2706   * K ( 'Name.Function.Internal' , identifier )
2707   * SkipSpace
2708   * Q "(" * Params * Q ")"
2709   * SkipSpace
2710   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1
2711   * ( C ( ( 1 - S ":\\r" ) ^ 0 ) / ParseAgain )
2712   * Q ":" 
2713   * ( SkipSpace
2714     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2715     * Tab ^ 0
2716     * SkipSpace
2717     * StringDoc ^ 0 -- there may be additional docstrings
2718   ) ^ -1
```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG `Keyword` (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```
2719 local ExceptionInConsole = Exception * Q ( ( 1 - P "\\r" ) ^ 0 ) * EOL
```

The main LPEG for the language Python

```

2720 local EndKeyword
2721   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
2722     EscapeMath + -1
```

First, the main loop :

```

2723 local Main =
2724   space ^ 0 * EOL -- faut-il le mettre en commentaire ?
2725   +
2726   + Space
2727   + Tab
2728   + Escape + EscapeMath
2729   + CommentLaTeX
2730   + Beamer
2731   + DetectedCommands
2732   + Prompt
2733   + LongString
2734   + Comment
2735   + ExceptionInConsole
2736   + Delim
```

```

2736      + Operator
2737      + OperatorWord * EndKeyword
2738      + ShortString
2739      + Punct
2740      + FromImport
2741      + RaiseException
2742      + DefFunction
2743      + DefClass
2744      + For
2745      + Keyword * EndKeyword
2746      + Decorator
2747      + Builtin * EndKeyword
2748      + Identifier
2749      + Number
2750      + Word

```

Here, we must not put local, of course.

```
2751 LPEG1.python = Main ^ 0
```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@_begin_line:` – `\@_end_line:`⁴¹.

```

2752 LPEG2.python =
2753   Ct (
2754     ( space ^ 0 * "\r" ) ^ -1
2755     * beamerBeginEnvironments
2756     * Lc [[ @_begin_line: ]]
2757     * SpaceIndentation ^ 0
2758     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2759     * -1
2760     * Lc [[ @_end_line: ]]
2761   )

```

End of the Lua scope for the language Python.

```
2762 end
```

10.3.5 The language Ocaml

We open a Lua local scope for the language OCaml (of course, there will be also global definitions).

```

2763 --ocaml Ocaml OCaml
2764 do

2765   local SkipSpace = ( Q " " + EOL ) ^ 0
2766   local Space = ( Q " " + EOL ) ^ 1

2767   local braces = Compute_braces ( '\"' * ( 1 - S '\"' ) ^ 0 * '\"' )
2768   % \end{macrocode}
2769   %
2770   % \bigskip
2771   % \begin{macrocode}
2772   if piton.beamer then Beamer = Compute_Beamer ( 'ocaml' , braces ) end
2773   DetectedCommands =
2774     Compute_DetectedCommands ( 'ocaml' , braces )
2775     + Compute_RawDetectedCommands ( 'ocaml' , braces )
2776   local Q

```

⁴¹Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

Usually, the following version of the function `Q` will be used without the second arguemnt (`strict`), that is to say in a loosy way. However, in some circumstances, we will a need the “strict” version, for instance in `DefFunction`.

```

2777   function Q ( pattern, strict )
2778     if strict ~= nil then
2779       return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2780     else
2781       return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2782         + Beamer + DetectedCommands + EscapeMath + Escape
2783     end
2784   end

2785   local K
2786   function K ( style , pattern, strict ) return
2787     Lc ( [[ {\PitonStylef }]] .. style .. "}{"
2788       * Q ( pattern, strict )
2789       * Lc "}"}
2790   end

2791   local WithStyle
2792   function WithStyle ( style , pattern ) return
2793     Ct ( Cc "Open" * Cc ( [[{\PitonStylef}]] .. style .. "}{") * Cc "}" )
2794       * (pattern + Beamer + DetectedCommands + EscapeMath + Escape)
2795       * Ct ( Cc "Close" )
2796   end

```

The following LPEG corresponds to the balanced expressions (balanced according to the parenthesis). Of course, we must write `(1 - S "()")` with outer parenthesis.

```

2797   local balanced_parens =
2798     P { "E" , E = ( "(" * V "E" * ")" + ( 1 - S "()" ) ) ^ 0 }

```

The strings of OCaml

```

2799   local ocaml_string =
2800     P "\\""
2801   *
2802     P " "
2803     +
2804     P ( ( 1 - S " \r" ) ^ 1 )
2805     +
2806     EOL -- ?
2807   ) ^ 0
2808   * P "\\""

2809   local String =
2810     WithStyle
2811     ( 'String.Long.Internal' ,
2812       Q "\\""
2813     *
2814       SpaceInString
2815       +
2816       Q ( ( 1 - S " \r" ) ^ 1 )
2817       +
2818       EOL
2819   ) ^ 0
2820   * Q "\\""
2821 )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2822 local ext = ( R "az" + "_" ) ^ 0
2823 local open = "{" * Cg ( ext , 'init' ) * "/"
2824 local close = "/" * C ( ext ) * "}"
2825 local closeeq =
2826   Cmt ( close * Cb ( 'init' ) ,
2827         function ( s , i , a , b ) return a == b end )

```

The LPEG `QuotedStringBis` will do the second analysis.

```

2828 local QuotedStringBis =
2829   WithStyle ( 'String.Long.Internal' ,
2830   (
2831     Space
2832     +
2833     Q ( ( 1 - S "\r" ) ^ 1 )
2834     +
2835     EOL
2836   ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2837 local QuotedString =
2838   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2839   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

In OCaml, the delimiters for the comments are (* and *). There are unsymmetrical and OCaml allows those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2840 local comment =
2841   P {
2842     "A" ,
2843     A = Q "(*"
2844     * ( V "A"
2845       + Q ( ( 1 - S "\r$\" - "(*" - "*") ) ^ 1 ) -- $
2846       + ocaml_string
2847       + "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * "$" -- $
2848       + EOL
2849     ) ^ 0
2850     * Q "*)"
2851   }
2852 local Comment = WithStyle ( 'Comment.Internal' , comment )

```

Some standard LPEG

```

2853 local Delim = Q ( P "[/" + "/" ) + S "[()]" )
2854 local Punct = Q ( S ",;:;" )

```

The identifiers caught by `cap_identifier` begin with a capital. In OCaml, it’s used for the constructors of types and for the names of the modules.

```

2855 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2856
2857 local Constructor =
2858   K ( 'Name.Constructor' ,
2859     Q "`" ^ -1 * cap_identifier

```

We consider :: and [] as constructors (of the lists) as does the Tuareg mode of Emacs.

```

2859   + Q "::"
2860   + Q ( "[" , true ) * SkipSpace * Q ( "]" , true )

```

```

2861 local ModuleType = K ( 'Name.Type' , cap_identifier )

2862 local OperatorWord =
2863   K ( 'Operator.Word' ,
2864     P "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" + "not" )

In OCaml, some keywords are considered as governing keywords with some special syntactic characteristics.

2865 local governing_keyword = P "and" + "begin" + "class" + "constraint" +
2866   "end" + "external" + "functor" + "include" + "inherit" + "initializer" +
2867   "in" + "let" + "method" + "module" + "object" + "open" + "rec" + "sig" +
2868   "struct" + "type" + "val"

2869 local Keyword =
2870   K ( 'Keyword' ,
2871     P "assert" + "as" + "done" + "downto" + "do" + "else" + "exception" +
2872     + "for" + "function" + "fun" + "if" + "lazy" + "match" + "mutable" +
2873     + "new" + "of" + "private" + "raise" + "then" + "to" + "try" +
2874     + "virtual" + "when" + "while" + "with" )
2875   + K ( 'Keyword.Constant' , P "true" + "false" )
2876   + K ( 'Keyword.Governing' , governing_keyword )

2877 local EndKeyword
2878   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape
2879   + EscapeMath + -1

```

Now, the identifier. Recall that we have also a LPEG `cap_identifier` for the identifiers beginning with a capital letter.

```

2880 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2881   - ( OperatorWord + Keyword ) * EndKeyword

```

We have the internal style `Identifier.Internal` in order to be able to implement the mechanism `\SetPitonIdentifier`. The final user has access to a style called `Identifier`.

```

2882 local Identifier = K ( 'Identifier.Internal' , identifier )

```

In OCmal, `character` is a type different of the type `string`.

```

2883 local ocaml_char =
2884   P "''" *
2885   (
2886     ( 1 - S "'\\\" )
2887     + "\\\"
2888     * ( S "\\\'ntbr \\"
2889       + digit * digit * digit
2890       + P "x" * ( digit + R "af" + R "AF" )
2891         * ( digit + R "af" + R "AF" )
2892           * ( digit + R "af" + R "AF" )
2893             + P "o" * R "03" * R "07" * R "07" )
2894   )
2895   * "''"
2896 local Char =
2897   K ( 'String.Short.Internal' , ocaml_char )

```

For the parameter of the types (for example : `\\a as in `a list).

```

2898 local TypeParameter =
2899   K ( 'TypeParameter' ,
2900     "'' * Q "_" ^ -1 * alpha ^ 1 * digit ^ 0 * ( # ( 1 - P "'' ) + -1 ) )

```

DotNotation Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2901 local DotNotation =
2902   (
2903     K ('Name.Module', cap_identifier)
2904     * Q "."
2905     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ -1
2906   +
2907     Identifier
2908     * Q "."
2909     * K ('Name.Field', identifier)
2910   )
2911   * ( Q "." * K ('Name.Field', identifier) ) ^ 0

```

The records

```

2912 local expression_for_fields_type =
2913   P { "E" ,
2914     E = ( "{" * V "F" * "}" "
2915       + "(" * V "F" * ")"
2916       + TypeParameter
2917       + ( 1 - S "{()}[]\r;" ) ) ^ 0 ,
2918     F = ( "{" * V "F" * "}" "
2919       + "(" * V "F" * ")"
2920       + ( 1 - S "{()}[]\r\\'"') + TypeParameter ) ^ 0
2921   }
2922
2923 local expression_for_fields_value =
2924   P { "E" ,
2925     E = ( "{" * V "F" * "}" "
2926       + "(" * V "F" * ")"
2927       + "[" * V "F" * "]"
2928       + ocaml_string + ocaml_char
2929       + ( 1 - S "{()}[];" ) ) ^ 0 ,
2930     F = ( "{" * V "F" * "}" "
2931       + "(" * V "F" * ")"
2932       + "[" * V "F" * "]"
2933       + ocaml_string + ocaml_char
2934       + ( 1 - S "{()}[]\\'") ) ^ 0
2935
2936 local OneFieldDefinition =
2937   ( K ('Keyword', "mutable") * SkipSpace ) ^ -1
2938   * K ('Name.Field', identifier) * SkipSpace
2939   * Q ":" * SkipSpace
2940   * K ('TypeExpression', expression_for_fields_type )
2941
2942 local OneField =
2943   K ('Name.Field', identifier) * SkipSpace
2944   * Q "=" * SkipSpace

```

Don't forget the parentheses!

```

2944   * ( C ( expression_for_fields_value ) / ParseAgain )
2945   * SkipSpace

```

The records.

```

2946 local RecordVal =
2947   Q "{" * SkipSpace
2948   *
2949   (

```

```

2950     (Identifier + DotNotation) * Space * K('Keyword', "with") * Space
2951   ) ^-1
2952 *
2953   (

2973   * SkipSpace
2974   * Q "}"
2975 local Record = RecordType + RecordVal

```

DotNotation Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2976 local DotNotation =
2977   (
2978     K ( 'Name.Module' , cap_identifier )
2979     * Q "."
2980     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ -1
2981   +
2982     Identifier
2983     * Q "."
2984     * K ( 'Name.Field' , identifier )
2985   )
2986   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0
2987
2988 local Operator =
2989   K ( 'Operator' ,
2990     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "/" + "&&" +
2991     "://" + "* *" + ";" + "->" + "+." + "-." + "*." + "/"
2992     + S "~+/*%=<>&@/"
2993
2994 local Builtin =
2995   K ( 'Name.Builtin' , P "incr" + "decr" + "fst" + "snd" + "ref" )
2996
2997 local Exception =
2998   K ( 'Exception' ,
2999     P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
3000     "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
3001     "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )
3002
3003 LPEG_cleaner.ocaml = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

An argument in the definition of a OCaml function may be of the form `(pattern:type)`. pattern may be a single identifier but it's not mandatory. First instance, it's possible to write in OCaml:

```
let head (a::q) = a
```

First, we write a pattern (in the LPEG sens!) to match what will be the pattern (in the OCaml sens).

```
3000 local pattern_part =
3001   ( P "(" * balanced_parens * ")" + ( 1 - S ":"() ) + P "::" ) ^ 0
```

For the "type" part, the LPEG-pattern will merely be `balanced_parens`.

We can now write a LPEG Argument which catches a argument of function (in the definition of the function).

```
3002 local Argument =

```

The following line is for the labels of the labeled arguments. Maybe we will, in the future, create a style for those elements.

```
3003   ( Q "~" * Identifier * Q ":" * SkipSpace ) ^ -1
3004   *
```

Now, the argument itself, either a single identifier, or a construction between parentheses

```
3005   (
3006     K ( 'Identifier.Internal' , identifier )
3007     +
3008     Q "(" * SkipSpace
3009     * ( C ( pattern_part ) / ParseAgain )
3010     * SkipSpace
```

Of course, the specification of type is optional.

```
3011   * ( Q ":" * #(1- P"=")
3012     * K ( 'TypeExpression' , balanced_parens ) * SkipSpace
3013     ) ^ -1
3014   * Q ")"
3015 )
```

Despite its name, then LPEG DefFunction deals also with `let open` which opens locally a module.

```
3016 local DefFunction =
3017   K ( 'Keyword.Governing' , "let open" )
3018   * Space
3019   * K ( 'Name.Module' , cap_identifier )
3020   +
3021   K ( 'Keyword.Governing' , P "let rec" + "let" + "and" )
3022   * Space
3023   * K ( 'Name.Function.Internal' , identifier )
3024   * Space
3025   * (
```

You use here the argument `strict` in order to allow a correct analyse of `let x = \uncover<2->{y}` (elsewhere, it's interpreted as a definition of a OCaml function).

```
3026   Q "=" * SkipSpace * K ( 'Keyword' , "function" , true )
3027   +
3028   Argument * ( SkipSpace * Argument ) ^ 0
3029   * (
3030     SkipSpace
3031     * Q ":" * # ( 1 - P "=" )
3032     * K ( 'TypeExpression' , ( 1 - P "=" ) ^ 0 )
3033   ) ^ -1
3034 )
```

DefModule

```
3035 local DefModule =
3036   K ( 'Keyword.Governing' , "module" ) * Space
3037   *
3038   (
3039     K ( 'Keyword.Governing' , "type" ) * Space
3040     * K ( 'Name.Type' , cap_identifier )
3041   +
3042     K ( 'Name.Module' , cap_identifier ) * SkipSpace
3043     *
3044     (
3045       Q "(" * SkipSpace
3046         * K ( 'Name.Module' , cap_identifier ) * SkipSpace
3047         * Q ":" * # ( 1 - P "=" ) * SkipSpace
3048         * K ( 'Name.Type' , cap_identifier ) * SkipSpace
3049         *
3050         (
3051           Q "," * SkipSpace
3052             * K ( 'Name.Module' , cap_identifier ) * SkipSpace
3053             * Q ":" * # ( 1 - P "=" ) * SkipSpace
3054               * K ( 'Name.Type' , cap_identifier ) * SkipSpace
3055             ) ^ 0
3056           * Q ")"
3057         ) ^ -1

3211   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

3212 local DefClass =
3213   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

```

3214 local Character =
3215   K ( 'String.Short' ,
3216     P [['\''']] + P """ * ( 1 - P """ ) ^ 0 * P """

```

The strings of C

```

3217 String =
3218   WithStyle ( 'String.Long.Internal' ,
3219     Q """
3220     * ( SpaceInString
3221       + K ( 'String.Interpol' ,
3222         "%" * ( S "difcspxXou" + "ld" + "li" + "hd" + "hi" )
3223         )
3224       + Q ( ( P "\\\\" + 1 - S " \" " ) ^ 1 )
3225     ) ^ 0
3226   * Q """
3227 )

```

Beamer The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

3228 local braces = Compute_braces ( """ * ( 1 - S """ ) ^ 0 * """
3229 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end

```

```

3230     DetectedCommands =
3231         Compute_DetectedCommands ( 'c' , braces )
3232         + Compute_RawDetectedCommands ( 'c' , braces )
3233     LPEG_cleaner.c = Compute_LPEG_cleaner ( 'c' , braces )

```

The directives of the preprocessor

```

3234     local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```

3235     local Comment =
3236         WithStyle ( 'Comment.Internal' ,
3237             Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
3238             * ( EOL + -1 )
3239
3240     local LongComment =
3241         WithStyle ( 'Comment.Internal' ,
3242             Q("/*"
3243                 * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
3244                 * Q "*/"
3245             ) -- $

```

The main LPEG for the language C

```

3246     local EndKeyword
3247         = Space + Punct + Delim + Beamer + DetectedCommands + Escape +
3248             EscapeMath + -1

```

First, the main loop :

```

3249     local Main =
3250         space ^ 0 * EOL
3251         + Space
3252         + Tab
3253         + Escape + EscapeMath
3254         + CommentLaTeX
3255         + Beamer
3256         + DetectedCommands
3257         + Preproc
3258         + Comment + LongComment
3259         + Delim
3260         + Operator
3261         + Character
3262         + String
3263         + Punct
3264         + DefFunction
3265         + DefClass
3266         + Type * ( Q "*" ^ -1 + EndKeyword )
3267         + Keyword * EndKeyword
3268         + Builtin * EndKeyword
3269         + Identifier
3270         + Number
3271         + Word

```

Here, we must not put `local`, of course.

```

3272     LPEG1.c = Main ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`⁴².

```

3273     LPEG2.c =
3274     Ct (
3275         ( space ^ 0 * P "\r" ) ^ -1
3276         * beamerBeginEnvironments
3277         * Lc [[ \@@_begin_line: ]]
3278         * SpaceIndentation ^ 0
3279         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3280         * -1
3281         * Lc [[ \@@_end_line: ]]
3282     )

```

End of the Lua scope for the language C.

```
3283 end
```

10.3.7 The language SQL

We open a Lua local scope for the language SQL (of course, there will be also global definitions).

```

3284 --sql SQL
3285 do

3286     local LuaKeyword
3287     function LuaKeyword ( name ) return
3288         Lc [[ {\PitonStyle{Keyword}}{ }]
3289         * Q ( Cmt (
3290             C ( letter * alphanum ^ 0 ) ,
3291             function ( s , i , a ) return string.upper ( a ) == name end
3292         )
3293         )
3294         * Lc "}"}
3295     end

```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```

3296     local identifier =
3297         letter * ( alphanum + "-" ) ^ 0
3298         + P '":"' * ( ( 1 - P '":"' ) ^ 1 ) * '":'
3299     local Operator =
3300         K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )

```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

The following function converts a comma-separated list in a "set", that is to say a Lua table with a fast way to test whether a string belongs to that set (eventually, the indexation of the components of the table is no longer done by integers but by the strings themselves).

```

3301     local Set
3302     function Set ( list )
3303         local set = { }
3304         for _ , l in ipairs ( list ) do set[l] = true end
3305         return set
3306     end

```

⁴²Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

We now use the previous function `Set` to creates the “sets” `set_keywords` and `set_builtin`. That list of keywords comes from https://sqlite.org/lang_keywords.html.

```

3307 local set_keywords = Set
3308 {
3309     "ABORT", "ACTION", "ADD", "AFTER", "ALL", "ALTER", "ALWAYS", "ANALYZE",
3310     "AND", "AS", "ASC", "ATTACH", "AUTOINCREMENT", "BEFORE", "BEGIN", "BETWEEN",

3328     "WHEN", "WHERE", "WINDOW", "WITH", "WITHOUT"
3329 }
3330 local set_builtins = Set
3331 {
3332     "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
3333     "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
3334     "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
3335 }
```

The LPEG `Identifier` will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

3336 local Identifier =
3337     C ( identifier ) /
3338     (
3339         function ( s )
3340             if set_keywords[string.upper(s)] then return
```

Remind that, in Lua, it’s possible to return *several* values.

```

3341     { {[{\PitonStyle{Keyword}}]} } ,
3342     { luatexbase.catcodetables.other , s } ,
3343     { "}" }
3344     else
3345         if set_builtins[string.upper(s)] then return
3346             { {[{\PitonStyle{Name.Builtin}}]} } ,
3347             { luatexbase.catcodetables.other , s } ,
3348             { "}" }
3349         else return
3350             { {[{\PitonStyle{Name.Field}}]} } ,
3351             { luatexbase.catcodetables.other , s } ,
3352             { "}" }
3353         end
3354     end
3355 end
3356 )
```

The strings of SQL

```

3357 local String = K ( 'String.Long.Internal' , ""'' * ( 1 - P ""'' ) ^ 1 * ""'' )
```

Beamer The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

3358 local braces = Compute_braces ( '"" * ( 1 - P "" ) ^ 1 * "" )
3359 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
3360 DetectedCommands =
3361   Compute_DetectedCommands ( 'sql' , braces )
3362   + Compute_RawDetectedCommands ( 'sql' , braces )
3363 LPEG_cleaner.sql = Compute_LPEG_cleaner ( 'sql' , braces )

```

The comments in the SQL listings We define different LPEG dealing with comments in the SQL listings.

```

3364 local Comment =
3365   WithStyle ( 'Comment.Internal' ,
3366     Q "--" -- syntax of SQL92

3449   *
3450   -1
3451   *
3452   Lc [[ \@@_end_line: ]]
3453 )

```

End of the Lua scope for the language SQL.

```
3448 end
```

10.3.8 The language “Minimal”

We open a Lua local scope for the language “Minimal” (of course, there will be also global definitions).

```

3449 --minimal Minimal
3450 do
```

⁴³Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

3451 local Punct = Q ( S ",:;!\\\" )
3452
3453 local Comment =
3454   WithStyle ( 'Comment.Internal' ,
3455     Q "#"
3456     * ( CommentMath + Q ( ( 1 - S "$\\r" ) ^ 1 ) ) ^ 0 -- $
3457   )
3458   * ( EOL + -1 )
3459
3460 local String =
3461   WithStyle ( 'String.Short.Internal' ,
3462     Q "\\" "
3463     * ( SpaceInString
3464       + Q ( ( P [[\]] ] + 1 - S " \\\" " ) ^ 1 )
3465     ) ^ 0
3466     * Q "\\" "
3467   )

```

The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

3468 local braces = Compute_braces ( P "\\\" * ( P "\\\" + 1 - P "\\\" ) ^ 1 * "\\\" )
3469
3470 if piton.beamer then Beamer = Compute_Beamer ( 'minimal' , braces ) end
3471
3472 DetectedCommands =
3473   Compute_DetectedCommands ( 'minimal' , braces )
3474   + Compute_RawDetectedCommands ( 'minimal' , braces )
3475
3476 LPEG_cleaner.minimal = Compute_LPEG_cleaner ( 'minimal' , braces )
3477
3478 local identifier = letter * alphanum ^ 0
3479
3480 local Identifier = K ( 'Identifier.Internal' , identifier )
3481
3482 local Delim = Q ( S "[()]" )
3483
3484 local Main =
3485   space ^ 0 * EOL
3486   + Space

3502   Ct (
3503     ( space ^ 0 * "\\r" ) ^ -1
3504     * beamerBeginEnvironments
3505     * Lc [[ \\@_begin_line: ]]
3506     * SpaceIndentation ^ 0
3507     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0

```

```

3508     * -1
3509     * Lc [[ \@@_end_line: ]]
3510 )

```

End of the Lua scope for the language “Minimal”.

```
3511 end
```

10.3.9 The language “Verbatim”

We open a Lua local scope for the language “Verbatim” (of course, there will be also global definitions).

```

3512 --verbatim Verbatim
3513 do

```

Here, we don’t use **braces** as done with the other languages because we don’t have have to take into account the strings (there is no string in the langage “Verbatim”).

```

3514 local braces =
3515   P { "E" ,
3516       E = ( {"*" * V "E" * "}"+ ( 1 - S "{}" ) ) ^ 0
3517     }
3518
3519 if piton.beamer then Beamer = Compute_Beamer ( 'verbatim' , braces ) end
3520
3521 DetectedCommands =
3522   Compute_DetectedCommands ( 'verbatim' , braces )
3523   + Compute_RawDetectedCommands ( 'verbatim' , braces )
3524
3525 LPEG_cleaner.verbatim = Compute_LPEG_cleaner ( 'verbatim' , braces )

```

Now, you will construct the LPEG Word.

```

3526 local lpeg_central = 1 - S "\\\r"
3527 if piton.begin_escape then
3528   lpeg_central = lpeg_central - piton.begin_escape
3529 end
3530 if piton.begin_escape_math then
3531   lpeg_central = lpeg_central - piton.begin_escape_math
3532 end
3533 local Word = Q ( lpeg_central ^ 1 )
3534
3535 local Main =
3536   space ^ 0 * EOL
3537   + Space
3538   + Tab
3539   + Escape + EscapeMath
3540   + Beamer
3541   + DetectedCommands
3542   + Q [[ ]]
3543   + Word

```

Here, we must not put **local**, of course.

```

3544 LPEG1.verbatim = Main ^ 0
3545
3546 LPEG2.verbatim =
3547   Ct (
3548     ( space ^ 0 * "\r" ) ^ -1
3549     * beamerBeginEnvironments
3550     * Lc [[ \@@_begin_line: ]]
3551     * SpaceIndentation ^ 0
3552     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3553     * -1
3554     * Lc [[ \@@_end_line: ]]
3555   )

```

End of the Lua scope for the language “verbatim”.

```
3556 end
```

10.3.10 The function Parse

The function **Parse** is the main function of the package **piton**. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (**LPEG2[language]**) which returns as capture a Lua table containing data to send to LaTeX.

```
3557 function piton.Parse ( language , code )
```

The variable **piton.language** will be used by the function **ParseAgain**.

```
3558     piton.language = language
3559     local t = LPEG2[language] : match ( code )
3560     if t == nil then
3561         sprintL3 [[ @@_error_or_warning:n { SyntaxError } ]]
3562         return -- to exit in force the function
3563     end
3564     local left_stack = {}
3565     local right_stack = {}
3566     for _ , one_item in ipairs ( t ) do
3567         if one_item[1] == "EOL" then
3568             for _ , s in ipairs ( right_stack ) do
3569                 tex.sprint ( s )
3570             end
3571             for _ , s in ipairs ( one_item[2] ) do
3572                 tex.tprint ( s )
3573             end
3574             for _ , s in ipairs ( left_stack ) do
3575                 tex.sprint ( s )
3576             end
3577         else
```

Here is an example of an item beginning with “Open”.

```
{ "Open" , "\begin{uncover}<2>" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (**{uncover}** in this example) at the end of each line and reopen it at the beginning of the new line. That’s why we use two Lua stacks, called **left_stack** and **right_stack**. **left_stack** will be for the elements like **\begin{uncover}<2>** and **right_stack** will be for the elements like **\end{uncover}**.

```
3578     if one_item[1] == "Open" then
3579         tex.sprint ( one_item[2] )
3580         table.insert ( left_stack , one_item[2] )
3581         table.insert ( right_stack , one_item[3] )
3582     else
3583         if one_item[1] == "Close" then
3584             tex.sprint ( right_stack[#right_stack] )
3585             left_stack[#left_stack] = nil
3586             right_stack[#right_stack] = nil
3587         else
3588             tex.tprint ( one_item )
3589         end
3590     end
3591   end
3592 end
3593 end
```

There is the problem of the conventions of end of lines (**\n** in Unix and Linux but **\r\n** in Windows). The function **cr_file_lines** will read a file line by line after replacement of the **\r\n** by **\n**.

```
3594 local cr_file_lines
```

```

3595 function cr_file_lines ( filename )
3596   local f = io.open ( filename , 'rb' )
3597   local s = f : read ( '*a' )
3598   f : close ( )
3599   return ( s .. '\n' ) : gsub( '\r\n?' , '\n') : gmatch ( '(.-)\n' )
3600 end

3601 function piton.ReadFile ( name , first_line , last_line )
3602   local s = ''
3603   local i = 0
3604   for line in cr_file_lines ( name ) do
3605     i = i + 1
3606     if i >= first_line then
3607       s = s .. '\r' .. line
3608     end
3609     if i >= last_line then break end
3610   end

```

We extract the BOM of utf-8, if present.

```

3611   if string.byte ( s , 1 ) == 13 then
3612     if string.byte ( s , 2 ) == 239 then
3613       if string.byte ( s , 3 ) == 187 then
3614         if string.byte ( s , 4 ) == 191 then
3615           s = string.sub ( s , 5 , -1 )
3616         end
3617       end
3618     end
3619   end
3620   sprintL3 ( [[ \tl_set:Nn \l_@@_listing_tl { } ]])
3621   tex.print ( luatexbase.catcodetables.CatcodeTableOther , s )
3622   sprintL3 ( [[ } ] ]
3623 end

3624 function piton.RetrieveGobbleParse ( lang , n , splittable , code )
3625   local s
3626   s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
3627   piton.GobbleParse ( lang , n , splittable , s )
3628 end

```

10.3.11 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols `#`.

```

3629 function piton.ParseBis ( lang , code )
3630   return piton.Parse ( lang , code : gsub ( '##' , '#' ) )
3631 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
3632 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space:]]` with a space after the name of the LaTeX command `\@@_breakable_space:`. Remember that `\@@_leading_space:` does not create a space, only an incrementation of the counter `\g_@@_indentation_int`. That's why we don't replace it by a space...

```

3633   return piton.Parse
3634   (
3635     lang ,

```

```

3636         code : gsub ( [ \@@_breakable_space: ] ] , ' ' )
3637         : gsub ( [ \@@_leading_space: ] ] , ' ' )
3638     )
3639 end

```

10.3.12 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

3640 local AutoGobbleLPEG =
3641   (
3642     P " " ^ 0 * "\r"
3643     +
3644     Ct ( C " " ^ 0 ) / table.getn
3645     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
3646   ) ^ 0
3647   * ( Ct ( C " " ^ 0 ) / table.getn
3648     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
3649 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

3650 local TabsAutoGobbleLPEG =
3651   (
3652     (
3653       P "\t" ^ 0 * "\r"
3654       +
3655       Ct ( C "\t" ^ 0 ) / table.getn
3656       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
3657     ) ^ 0
3658     * ( Ct ( C "\t" ^ 0 ) / table.getn
3659       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
3660   ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

3661 local EnvGobbleLPEG =
3662   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
3663   * Ct ( C " " ^ 0 * -1 ) / table.getn
3664 local remove_before_cr
3665 function remove_before_cr ( input_string )
3666   local match_result = ( P "\r" ) : match ( input_string )
3667   if match_result then return
3668   string.sub ( input_string , match_result )
3669   else return
3670   input_string
3671 end
3672 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

3673 function piton.Gobble ( n , code )
3674   code = remove_before_cr ( code )
3675   if n == 0 then return
3676   code
3677   else
3678     if n == -1 then
3679       n = AutoGobbleLPEG : match ( code )

```

for the cas of an empty environment (only blank lines)

```

3680     if tonumber(n) then else n = 0 end
3681   else
3682     if n == -2 then
3683       n = EnvGobbleLPEG : match ( code )
3684     else
3685       if n == -3 then
3686         n = TabsAutoGobbleLPEG : match ( code )
3687         if tonumber(n) then else n = 0 end
3688       end
3689     end
3690   end

```

We have a second test `if n == 0` because, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

3691   if n == 0 then return
3692     code
3693   else return

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of `n`.

```

3694   ( Ct (
3695     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
3696     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
3697     ) ^ 0 )
3698     / table.concat
3699   ) : match ( code )
3700   end
3701 end
3702 end

```

In the following code, `n` is the value of `\l_@@_gobble_int`.
`splittable` is the value of `\l_@@_splittable_int`.

```

3703 function piton.GobbleParse ( lang , n , splittable , code )
3704   piton.ComputeLinesStatus ( code , splittable )
3705   piton.last_code = piton.Gobble ( n , code )
3706   piton.last_language = lang

```

We count the number of lines of the computer listing. The result will be stored by Lua in `\g_@@_nb_lines_int`.

```

3707   piton.CountLines ( piton.last_code )
3708   piton.Parse ( lang , piton.last_code )
3709   sprintL3 [[ \vspace{2.5pt} ]]

```

We finish the paragraph (each line of the listing is composed in a TeX box — with potentially several lines when `break-lines-in-Piton` is in force — put alone in a paragraph.

```

3710   sprintL3 [[ \par ]]
3711   piton.join_and_write ( )
3712 end

```

The following function will be used when the final user has used the key `join` or the key `write`. The value of the key `join` has been written in the Lua variable `piton.join`.

```

3713 function piton.join_and_write ( )
3714   if piton.join ~= '' then
3715     if piton.join_files [ piton.join ] == nil then
3716       piton.join_files [ piton.join ] = piton.get_last_code ( )
3717     else
3718       piton.join_files [ piton.join ] =
3719       piton.join_files [ piton.join ] .. "\r\n" .. piton.get_last_code ( )
3720     end
3721   end
3722 %   \end{macrocode}
3723 %

```

```

3724 % Now, if the final user has used the key /write/ to write the listing of the
3725 % environment on an external file (on the disk).
3726 %
3727 % We have written the values of the keys /write/ and /path-write/ in the Lua
3728 % variables /piton.write/ and /piton.path-write/.
3729 %
3730 % If /piton.write/ is not empty, that means that the key /write/ has been used
3731 % for the current environment and, hence, we have to write the content of the
3732 % listing on the corresponding external file.
3733 % \begin{macrocode}
3734 if piton.write ~= '' then

```

We will write on `file_name` the full name (with the path) of the file in which we will write.

```

3735 local file_name =
3736 if piton.path_write == '' then
3737   file_name = piton.write
3738 else

```

If `piton.path-write` is not empty, that means that we will not write on a file in the current directory but in another directory. First, we verify that that directory actually exists.

```

3739 local attr = lfs.attributes ( piton.path_write )
3740 if attr and attr.mode == "directory" then
3741   file_name = piton.path_write .. "/" .. piton.write
3742 else

```

If the directory does *not* exist, you raise an (non-fatal) error since TeX is not able to create a new directory.

```

3743   sprintL3 [[ \@@_error_or_warning:n { InexistentDirectory } ]]
3744 end
3745 end
3746 if file_name ~= '' then

```

Now, `file_name` contains the complete name of the file on which we will have to write. Maybe the file does not exist but we are sure that the directory exist.

The Lua table `piton.write_files` is a table of Lua strings corresponding to all the files that we will write on the disk in the `\AtEndDocument`. They correspond to the use of the key `write` (and `path-write`).

```

3747 if piton.write_files [ file_name ] == nil then
3748   piton.write_files [ file_name ] = piton.get_last_code ( )
3749 else
3750   piton.write_files [ file_name ] =
3751   piton.write_files [ file_name ] .. "\n" .. piton.get_last_code ( )
3752 end
3753 end
3754 end
3755 end

```

The following command will be used when the final user has set `print=false`.

```

3756 function piton.GobbleParseNoPrint ( lang , n , code )
3757   piton.last_code = piton.Gobble ( n , code )
3758   piton.last_language = lang
3759   piton.join_and_write ( )
3760 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the computer listing is split in chunks at the empty lines (usually between the abstract functions defined in the computer code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```

3761 function piton.GobbleSplitParse ( lang , n , splittable , code )
3762   local chunks
3763   chunks =
3764   (
3765     Ct (

```

```

3766      (
3767          P " " ^ 0 * "\r"
3768          +
3769          C ( ( ( 1 - P "\r" ) ^ 1 * ( P "\r" + -1 )
3770              - ( P " " ^ 0 * ( P "\r" + -1 ) )
3771                  ) ^ 1
3772          )
3773      ) ^ 0
3774  )
3775  ) : match ( piton.Gobble ( n , code ) )
3776 sprintL3 [[ \begingroup ]]
3777 sprintL3
3778  (
3779      [[ \PitonOptions { split-on-empty-lines = false, gobble = 0, }]
3780      .. "language = " .. lang .. ","
3781      .. "splittable = " .. splittable .. "}]
3782  )
3783 for k , v in pairs ( chunks ) do
3784     if k > 1 then
3785         sprintL3 ( [[ \l_@@_split_separation_t1 ]] )
3786     end
3787     tex.print
3788     (
3789         [[\begin{}]] .. piton.env_used_by_split .. "}\r"
3790         .. v
3791         .. [[\end{}]] .. piton.env_used_by_split .. "}\r" -- previously: }%\r
3792     )
3793 end
3794 sprintL3 [[ \endgroup ]]
3795 end

3796 function piton.RetrieveGobbleSplitParse ( lang , n , splittable , code )
3797     local s
3798     s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
3799     piton.GobbleSplitParse ( lang , n , splittable , s )
3800 end

```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legibility. The token list `\l_@@_split_separation_t1` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```

3801 piton.string_between_chunks =
3802 [[ \par \l_@@_split_separation_t1 \mode_leave_vertical: ]]
3803 .. [[ \int_gzero:N \g_@@_line_int ]]

```

The counter `\g_@@_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```

3804 function piton.get_last_code ( )
3805     return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
3806         : gsub ('\r\n', '\n') : gsub ('\r', '\n')
3807 end

```

10.3.13 To count the number of lines

```

3808 function piton.CountLines ( code )
3809     local count = 0
3810     count =
3811         ( Ct ( ( ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
3812             * ( ( 1 - P "\r" ) ^ 1 * Cc "\r" ) ^ -1
3813             * -1

```

```

3814         ) / table.getn
3815     ) : match ( code )
3816   sprintL3 ( string.format ( [[ \int_gset:Nn \g_@@_nb_lines_int { %i } ]] , count ) )
3817 end

The following function is only used once (in piton.GobbleParse). We have written an autonomous function only for legibility. The number of lines of the code will be stored in \l_@@_nb_non_empty_lines_int. It will be used to compute the largest number of lines to write (when line-numbers is in force).
3818 function piton.CountNonEmptyLines ( code )
3819   local count = 0
3820   count =
3821     ( Ct ( ( P " " ^ 0 * "\r"
3822           + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
3823           * ( 1 - P "\r" ) ^ 0
3824           * -1
3825         ) / table.getn
3826     ) : match ( code )
3827   sprintL3
3828     ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { %i } ]] , count ) )
3829 end

3830 function piton.CountLinesFile ( name )
3831   local count = 0
3832   for line in io.lines ( name ) do count = count + 1 end
3833   sprintL3
3834     ( string.format ( [[ \int_gset:Nn \g_@@_nb_lines_int { %i } ]] , count ) )
3835 end

3836 function piton.CountNonEmptyLinesFile ( name )
3837   local count = 0
3838   for line in io.lines ( name ) do
3839     if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
3840       count = count + 1
3841     end
3842   end
3843   sprintL3
3844     ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { %i } ]] , count ) )
3845 end

```

The following function stores in \l_@@_first_line_int and \l_@@_last_line_int the numbers of lines of the file file_name corresponding to the strings marker_beginning and marker_end. s is the marker of the beginning and t is the marker of the end.

```

3846 function piton.ComputeRange(s,t,file_name)
3847   local first_line = -1
3848   local count = 0
3849   local last_found = false
3850   for line in io.lines ( file_name ) do
3851     if first_line == -1 then
3852       if string.sub ( line , 1 , #s ) == s then
3853         first_line = count
3854       end
3855     else
3856       if string.sub ( line , 1 , #t ) == t then
3857         last_found = true
3858         break
3859       end
3860     end
3861     count = count + 1
3862   end
3863   if first_line == -1 then

```

```

3864   sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
3865   else
3866     if last_found == false then
3867       sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
3868     end
3869   end
3870   sprintL3 (
3871     [[ \int_set:Nn \l_@@_first_line_int { } ] .. first_line .. ' + 2 ]'
3872     .. [[ \int_set:Nn \l_@@_last_line_int { } ] .. count .. ' }' )
3873 end

```

10.3.14 To determine the empty lines of the listings

Despite its name, the Lua function `ComputeLinesStatus` computes `piton.lines_status` but also `piton.empty_lines`.

In `piton.empty_lines`, a line will have the number 0 if it's a empty line (in fact a blank line, with only spaces) and 1 elsewhere.

In `piton.lines_status`, each line will have a status with regard the breaking points allowed (for the changes of pages).

- 0 if the line is empty and a page break is allowed;
- 1 if the line is not empty but a page break is allowed after that line;
- 2 if a page break is *not* allowed after that line (empty or not empty).

`splittable` is the value of `\l_@@_splittable_int`. However, if `splittable-on-empty-lines` is in force, `splittable` is the opposite of `\l_@@_splittable_int`.

```
3874 function piton.ComputeLinesStatus ( code , splittable )
```

The lines in the listings which correspond to the beginning or the end of an environment of Beamer (eg. `\begin{uncoverenv}`) must be retrieved (those lines have *no* number and therefore, *no* status).

```

3875   local lpeg_line_beamer
3876   if piton.beamer then
3877     lpeg_line_beamer =
3878       space ^ 0
3879       * P [[\begin{}]] * beamerEnvironments * "}"
3880       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
3881       +
3882       space ^ 0
3883       * P [[\end{}]] * beamerEnvironments * "}"
3884   else
3885     lpeg_line_beamer = P ( false )
3886   end
3887
3888   local lpeg_empty_lines =
3889   Ct (
3890     ( lpeg_line_beamer * "\r"
3891       +
3892       P " " ^ 0 * "\r" * Cc ( 0 )
3893       +
3894       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3895       ) ^ 0
3896       *
3897       ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3898   )
3899   * -1
3900
3901   local lpeg_all_lines =
3902   Ct (
3903     ( lpeg_line_beamer * "\r"
3904       +
3905       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )

```

```

3904     ) ^ 0
3905     *
3906     ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3907   )
3908   * -1

```

We begin with the computation of `piton.empty_lines`. It will be used in conjunction with `line-numbers`.

```
3909   piton.empty_lines = lpeg_empty_lines : match ( code )
```

Now, we compute `piton.lines_status`. It will be used in conjunction with `splittable` and `splittable-on-empty-lines`.

Now, we will take into account the current value of `\l_@@_splittable_int` (provided by the *absolute value* of the argument `splittable`).

```

3910   local lines_status
3911   local s = splittable
3912   if splittable < 0 then s = - splittable end
3913   if splittable > 0 then
3914     lines_status = lpeg_all_lines : match ( code )
3915   else

```

Here, we should try to copy `piton.empty_lines` but it's not easy.

```

3916   lines_status = lpeg_empty_lines : match ( code )
3917   for i , x in ipairs ( lines_status ) do
3918     if x == 0 then
3919       for j = 1 , s - 1 do
3920         if i + j > #lines_status then break end
3921         if lines_status[i+j] == 0 then break end
3922         lines_status[i+j] = 2
3923       end
3924       for j = 1 , s - 1 do
3925         if i - j == 1 then break end
3926         if lines_status[i-j-1] == 0 then break end
3927         lines_status[i-j-1] = 2
3928       end
3929     end
3930   end
3931 end

```

In all cases (whatever is the value of `splittable-on-empty-lines`) we have to deal with both extremities of the listing to format.

First from the beginning of the code.

```

3932   for j = 1 , s - 1 do
3933     if j > #lines_status then break end
3934     if lines_status[j] == 0 then break end
3935     lines_status[j] = 2
3936   end

```

Now, from the end of the code.

```

3937   for j = 1 , s - 1 do
3938     if #lines_status - j == 0 then break end
3939     if lines_status[#lines_status - j] == 0 then break end
3940     lines_status[#lines_status - j] = 2
3941   end

3942   piton.lines_status = lines_status
3943 end

```

10.3.15 To create new languages with the syntax of listings

```

3944 function piton.new_language ( lang , definition )
3945   lang = string.lower ( lang )

3946   local alpha , digit = lpeg.alpha , lpeg.digit
3947   local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key `)`) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

3948   function add_to_letter ( c )
3949     if c ~= " " then table.insert ( extra_letters , c ) end
3950   end

```

For the digits, it's straightforward.

```

3951   function add_to_digit ( c )
3952     if c ~= " " then digit = digit + c end
3953   end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

3954   local other = S ":_@+-*/<>!?:.()[]~^=#&\"\\\$" -- $
3955   local extra_others = { }
3956   function add_to_other ( c )
3957     if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

3958     extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for languages such as HTML and XML) for the character `/` in the closing tags `</....>`.

```

3959     other = other + P ( c )
3960   end
3961 end

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

3962   local def_table
3963   if ( S ", " ^ 0 * -1 ) : match ( definition ) then
3964     def_table = {}
3965   else
3966     local strict_braces =
3967       P { "E" ,
3968         E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
3969         F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
3970       }
3971     local cut_definition =
3972       P { "E" ,
3973         E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
3974         F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
3975                   * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
3976       }
3977     def_table = cut_definition : match ( definition )
3978   end

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

3979 local tex_braced_arg = "{" * C ( ( 1 - P "]" ) ^ 0 ) * "}"
3980 local tex_arg = tex_braced_arg + C ( 1 )
3981 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
3982 local args_for_tag
3983   = tex_option_arg
3984   * space ^ 0
3985   * tex_arg
3986   * space ^ 0
3987   * tex_arg
3988 local args_for_morekeywords
3989   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3990   * space ^ 0
3991   * tex_option_arg
3992   * space ^ 0
3993   * tex_arg
3994   * space ^ 0
3995   * ( tex_braced_arg + Cc ( nil ) )
3996 local args_for_moredelims
3997   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
3998   * args_for_morekeywords
3999 local args_for_morecomment
4000   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
4001   * space ^ 0
4002   * tex_option_arg
4003   * space ^ 0
4004   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

4005 local sensitive = true
4006 local style_tag , left_tag , right_tag
4007 for _ , x in ipairs ( def_table ) do
4008   if x[1] == "sensitive" then
4009     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
4010       sensitive = true
4011     else
4012       if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
4013     end
4014   end
4015   if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
4016   if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
4017   if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
4018   if x[1] == "tag" then
4019     style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
4020     style_tag = style_tag or {[PitonStyle[Tag]]}
4021   end
4022 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

4023 local Number =
4024   K ( 'Number.Internal' ,
4025     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
4026       + digit ^ 0 * "." * digit ^ 1
4027       + digit ^ 1 )
4028     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
4029     + digit ^ 1
4030   )
4031 local string_extra_letters = ""
4032 for _ , x in ipairs ( extra_letters ) do
4033   if not ( extra_others[x] ) then
4034     string_extra_letters = string_extra_letters .. x

```

```

4035     end
4036   end
4037   local letter = alpha + S ( string_extra_letters )
4038     + P "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
4039     + "ô" + "û" + "ü" + "Ã" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
4040     + "í" + "Î" + "Ô" + "Û" + "Ü"
4041   local alphanum = letter + digit
4042   local identifier = letter * alphanum ^ 0
4043   local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

4044   local split_clist =
4045     P { "E" ,
4046       E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
4047         * ( P "{" ) ^ 1
4048         * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
4049         * ( P "}" ) ^ 1 * space ^ 0 ,
4050       F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
4051   }

```

The following function will be used if the keywords are not case-sensitive.

```

4052   local keyword_to_lpeg
4053   function keyword_to_lpeg ( name ) return
4054     Q ( Cmt (
4055       C ( identifier ) ,
4056       function ( s , i , a ) return
4057         string.upper ( a ) == string.upper ( name )
4058       end
4059     )
4060   )
4061 end
4062 local Keyword = P ( false )
4063 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

4064   for _ , x in ipairs ( def_table )
4065     do if x[1] == "morekeywords"
4066       or x[1] == "otherkeywords"
4067       or x[1] == "moredirectives"
4068       or x[1] == "moretexcs"
4069     then
4070       local keywords = P ( false )
4071       local style = {[PitonStyle{Keyword}]}
4072       if x[1] == "moredirectives" then style = {[PitonStyle{Directive}]} end
4073       style = tex_option_arg : match ( x[2] ) or style
4074       local n = tonumber ( style )
4075       if n then
4076         if n > 1 then style = {[PitonStyle{Keyword}]] .. style .. "}" end
4077       end
4078       for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
4079         if x[1] == "moretexcs" then
4080           keywords = Q ( {[}] .. word ) + keywords
4081         else
4082           if sensitive

```

The documentation of `lstlistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

4083     then keywords = Q ( word ) + keywords
4084     else keywords = keyword_to_lpeg ( word ) + keywords
4085     end
4086   end

```

```

4087     end
4088     Keyword = Keyword +
4089     Lc ( "{" .. style .. "{" ) * keywords * Lc "}""
4090 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there are two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That’s why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

4091     if x[1] == "keywordsprefix" then
4092         local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
4093         PrefixedKeyword = PrefixedKeyword
4094             + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
4095     end
4096 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

4097     local long_string = P ( false )
4098     local Long_string = P ( false )
4099     local LongString = P ( false )
4100     local central_pattern = P ( false )
4101     for _ , x in ipairs ( def_table ) do
4102         if x[1] == "morestring" then
4103             arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
4104             arg2 = arg2 or {[PitonStyle[String.Long]}]
4105             if arg1 ~= "s" then
4106                 arg4 = arg3
4107             end
4108             central_pattern = 1 - S ( " \r" .. arg4 )
4109             if arg1 : match "b" then
4110                 central_pattern = P ( {[}] .. arg3 ) + central_pattern
4111             end

```

In fact, the specifier `d` is point-less: when it is not in force, it’s still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

4112     if arg1 : match "d" or arg1 == "m" then
4113         central_pattern = P ( arg3 .. arg3 ) + central_pattern
4114     end
4115     if arg1 == "m"
4116     then prefix = B ( 1 - letter - ")" - "]" )
4117     else prefix = P ( true )
4118     end

```

First, a pattern *without captures* (needed to compute `braces`).

```

4119     long_string = long_string +
4120         prefix
4121         * arg3
4122         * ( space + central_pattern ) ^ 0
4123         * arg4

```

Now a pattern *with captures*.

```

4124     local pattern =
4125         prefix
4126         * Q ( arg3 )
4127         * ( SpaceInString + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
4128         * Q ( arg4 )

```

We will need `Long_string` in the nested comments.

```

4129     Long_string = Long_string + pattern
4130     LongString = LongString +
4131         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" ) * Cc "}" )
4132         * pattern
4133         * Ct ( Cc "Close" )
4134     end
4135 end

```

The argument of `Compute_braces` must be a pattern which does no catching corresponding to the strings of the language.

```

4136 local braces = Compute_braces ( long_string )
4137 if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
4138
4139 DetectedCommands =
4140     Compute_DetectedCommands ( lang , braces )
4141     + Compute_RawDetectedCommands ( lang , braces )
4142
4143 LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

4144 local CommentDelim = P ( false )
4145
4146 for _ , x in ipairs ( def_table ) do
4147     if x[1] == "morecomment" then
4148         local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
4149         arg2 = arg2 or {[PitonStyle{Comment}]}

```

If the letter `i` is present in the first argument (eg: `morecomment = [si]{(*){}}`, then the corresponding comments are discarded.

```

4150     if arg1 : match "i" then arg2 = {[PitonStyle{Discard}]} end
4151     if arg1 : match "l" then
4152         local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
4153             : match ( other_args )
4154         if arg3 == {[#]} then arg3 = "#" end -- mandatory
4155         if arg3 == {[%]} then arg3 = "%" end -- mandatory
4156         CommentDelim = CommentDelim +
4157             Ct ( Cc "Open"
4158                 * Cc ( "{" .. arg2 .. "}" ) * Cc "}" )
4159                 * Q ( arg3 )
4160                 * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $

4313     * Lc [[ \@@_end_line: ]]
4314   )
4315 end
4316 end

```

10.3.16 We write the files (key 'write') and join the files in the PDF (key 'join')

```

4317 function piton.join_and_write_files ( )
4318   for file_name , file_content in pairs ( piton.write_files ) do
4319     local file = io.open ( file_name , "w" )
4320     if file then
4321       file : write ( file_content )
4322       file : close ( )
4323     else
4324       sprintL3
4325         ( [[ \@@_error_or_warning:nn { FileError } { } ] .. file_name .. [[ } ] ] )
4326     end
4327
4328   for file_name , file_content in pairs ( piton.join_files ) do
4329     pdf.immediateobj("stream", file_content)
4330     tex.print
4331     (
4332       [[ \pdfextension annot width Opt height Opt depth Opt ]]
4333       ..

```

The entry /F in the PDF dictionnary of the annotation is an unsigned 32-bit integer containing flags specifying various characteristics of the annotation. The bit in position 2 means *Hidden*. However, despite that bit which means *Hidden*, some PDF readers show the annotation. That's why we have used width Opt height Opt depth Opt.

```

4334   [[ { /Subtype /FileAttachment /F 2 /Name /Paperclip} ]]
4335   ..
4336   [[ /Contents (File included by the key 'join' of piton) ]]
4337   ..

```

We recall that the value of `file_name` comes from the key `join`, and that we have converted immediately the value of the key in utf16 (with the bom big endian) written in hexadecimal. It's the suitable form for insertion as value of the key /UF between angular brackets < and >.

```

4338   [[ /FS << /Type /Filespec /UF <> ] .. file_name .. [[>]] ]
4339   ..
4340   [[ /EF << /F \pdffeedback lastobj 0 R >> >> } ] ]
4341   )
4342 end
4343 end
4344
4345 
```

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:
<https://github.com/fpantigny/piton>

Changes between versions 4.7 and 4.8

New key `\rowcolor`

The command `\label` redefined by `piton` is now compatible with `hyperref` (thanks to P. Le Scornet).
New key `label-as-zlabel`.

Changes between versions 4.6 and 4.7

New key `rounded-corners`

Changes between versions 4.5 and 4.6

New keys `tcolorbox`, `box`, `max-width` and `vertical-detected-commands`

New special color: `none`

Changes between versions 4.4 and 4.5

New key `print`

`\RenewPitonEnvironment`, `\DeclarePitonEnvironment` and `\ProvidePitonEnvironment` have been added.

Changes between versions 4.3 and 4.4

New key `join` which generates files embedded in the PDF as *joined files*.

Changes between versions 4.2 and 4.3

New key `raw-detected-commands`

The key `old-PitonInputFile` has been deleted.

Changes between versions 4.1 and 4.2

New key `break-numbers-anywhere`.

Changes between versions 4.0 and 4.1

New language `verbatim`.

New key `break-strings-anywhere`.

Changes between versions 3.1 and 4.0

This version introduces an incompatibility: the syntax for the relative and absolute paths in `\PitonInputFile` and the key `path` has been changed to be conform to usual conventions. A temporary key `old-PitonInputFile`, available at load-time, has been added for backward compatibility.

New keys `font-command`, `splittable-on-empty-lines` and `env-used-by-split`.

Changes between versions 3.0 and 3.1

Keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new computer languages with the syntax used by listings. Therefore, it's possible to say that virtually all the computer languages are now supported by piton.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of paths where the files to include will be searched.
New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

4.2.2	Global styles and local styles	8
4.2.3	The style UserFunction	8
4.3	Creation of new environments	9
5	Definition of new languages with the syntax of listings	10
6	Advanced features	11
6.1	The key “box”	11
6.2	The key “tcolorbox”	12
6.3	Insertion of a file	17
6.3.1	The command \PitonInputFile	17
6.3.2	Insertion of a part of a file	17
6.4	Page breaks and line breaks	19
6.4.1	Line breaks	19
6.4.2	Page breaks	20
6.5	Splitting of a listing in sub-listings	21
6.6	Highlighting some identifiers	22
6.7	Mechanisms to escape to LaTeX	23
6.7.1	The “LaTeX comments”	23
6.7.2	The key “label-as-zlabel”	24
6.7.3	The key “math-comments”	24
6.7.4	The key “detected-commands” and its variants	24
6.7.5	The mechanism “escape”	26
6.7.6	The mechanism “escape-math”	27
6.7.7	The command \rowcolor	27
6.8	Behaviour in the class Beamer	28
6.8.1	{Piton} and \PitonInputFile are “overlay-aware”	28
6.8.2	Commands of Beamer allowed in {Piton} and \PitonInputFile	29
6.8.3	Environments of Beamer allowed in {Piton} and \PitonInputFile	29
6.9	Footnotes in the environments of piton	30
6.10	Tabulations	32
7	API for the developpers	32
8	Examples	32
8.1	An example of tuning of the styles	32
8.2	Line numbering	33
8.3	Formatting of the LaTeX comments	34
8.4	Use with tcolorbox	34
8.5	Use with pyluatex	38

9	The styles for the different computer languages	39
9.1	The language Python	39
9.2	The language OCaml	40
9.3	The language C (and C++)	41
9.4	The language SQL	42
9.5	The languages defined by \NewPitonLanguage	43
9.6	The language “minimal”	44
9.7	The language “verbatim”	44
10	Implementation	45
10.1	Introduction	45
10.2	The L3 part of the implementation	46
10.2.1	Declaration of the package	46
10.2.2	Parameters and technical definitions	49
10.2.3	Detected commands	54
10.2.4	Treatment of a line of code	55
10.2.5	PitonOptions	60
10.2.6	The numbers of the lines	66
10.2.7	The main commands and environments for the final user	67
10.2.8	The styles	81
10.2.9	The initial styles	84
10.2.10	Highlighting some identifiers	85
10.2.11	Security	87
10.2.12	The error messages of the package	87
10.2.13	We load piton.lua	91
10.3	The Lua part of the implementation	91
10.3.1	Special functions dealing with LPEG	92
10.3.2	The functions Q, K, WithStyle, etc.	92
10.3.3	The option ‘detected-commands’ and al.	95
10.3.4	The language Python	99
10.3.5	The language Ocaml	106
10.3.6	The language C	115
10.3.7	The language SQL	118
10.3.8	The language “Minimal”	121
10.3.9	The language “Verbatim”	123
10.3.10	The function Parse	124
10.3.11	Two variants of the function Parse with integrated preprocessors	125
10.3.12	Preprocessors of the function Parse for gobble	126
10.3.13	To count the number of lines	129
10.3.14	To determine the empty lines of the listings	131
10.3.15	To create new languages with the syntax of listings	133
10.3.16	We write the files (key ‘write’) and join the files in the PDF (key ‘join’)	140
11	History	141
